Re: Approval of de maximis inc. report titled *Holding Basin Containment Wall and Cap Pre-Design Investigations* (the "PDI Report") dated September 23, 2022

Nuclear Metals, Inc. Superfund Site

Dear Mr. Thompson:

EPA, in consultation with the Massachusetts Department of Environmental Protection, has completed its review of the *Holding Basin Containment Wall and Cap Pre-Design Investigations*, dated September 23, 2022. The PDI report was revised in response to EPA comments dated August 10, 2022. The PDI Report is subject to the terms and conditions specified in the Consent Decree (CD) for Remedial Design / Remedial Action (RD/RA) for the Nuclear Metals Inc. Site, which has an effective date of December 6, 2019.

EPA reviewed the revisions to the PDI Report and finds that they are acceptable. Therefore, EPA approves the PDI Report.

If there is any conflict between the Performance Standards as stated in the Work Plan and the Performance Standards as stated in the CD and statement of work (SOW), the CD and SOW shall control.

Please do not hesitate to contact me at nierenberg.kara@epa.gov or (617) 918-1435 should you have any questions.

Sincerely,

Kara Nierenberg
Remedial Project Manager

Response to Comments on Holding Basin Containment Wall and Cap Pre-Design Investigations Report

Dear Mr. Smith:

The purpose of this letter is to provide our response to the comments received on August 10, 2022 on the Report titled *Holding Basin Containment Wall and Cap Pre-Design Investigations (PDI) Report* dated December 23, 2021. Each comment is included below, with a response following each comment accordingly.

General Comments

1. A description of the design process would help clarify how the PDI data will be used in the design phase. Specifically, describe how with the kinematic stability analysis and seepage analysis will inform the mix selection process and testing. As stated below a list identifying the major design criteria would be helpful. Established criteria values should be presented. If specific values are not yet established, then present the point in the design process when the criteria values will be established.

   Response: The design process and specific details of the design criteria are provided in Sections 2.2 and 5.1 of the text.

2. When noting that a specific number of borings/wells were completed (e.g., "Drilling of six (6) investigation borings"), please edit the bullet points to include the names of the borings/wells completed (or figure/table reference) for each investigation item to help the reader orient themselves to the work completed. For example, state "Drilling of six (6) investigation borings (locations HA20-

CMT-1 through HA20-CMT-6)."

Response: Comment noted, and changes were made throughout the document to clarify.

Specific Comments

3. **Section 2.3, Page 4, Table.** The Pre-design Investigation (PDI) Scope presented in the Table does not match the PDI Scope presented in the Remedial Design Work Plan – Appendix C (September 2020) (RDWP). Specifically, the RDWP for PDI HB-3 calls for bench scale testing of up to five containment wall mix designs and test on bentonite slurry, but the PDI only includes a literature survey of concrete mix performance. Please clarify this scope change in Section 2.3.

   Response: A scope change explanation has been added to Section 2.3. Feedback from the agencies on the hydraulic conductivity requirements summarized in Appendix E, PDI HB-5, is necessary before selecting mix designs for hydraulic conductivity testing. Each of the concrete mix designs summarized in Appendix C, PDI HB-3, is targeted for a hydraulic conductivity of approximately 1 x 10^{-8} to 1 x 10^{-6} centimeters per second (cm/s) or less.

4. **Section 3.1, Page 6.** The fourth (and last paragraph) of this section discusses the exclusion zone created surrounding the drill rig and has conflicting statements. The second sentence states the exclusion zone was accessed "only [by] the driller and driller's helper"; however, the following sentence states the field geologist and RSO personnel also accessed the exclusion zone. Please clarify the text.

   Response: Clarifying text has been added to Section 3.1.

5. **Section 3.5, Page 8.** In paragraph four, please update the text to include the analytical methods performed for each of the samples submitted for analysis to Alpha Analytical Labs.

   Response: Analytical methods used by Alpha Analytical and GEL Laboratories have been added to Section 3.5.

6. **Section 5, Page 10.** It is not clear how the specific PDI data will be used to form the design basis for the holding basin containment. A table listing specific design criteria (e.g., lithology, soil strength, permeability), and data sources (e.g., PDI boring, lab test, empirical relationship, literature values) that have been developed from the PDI and will be used in 30% Design calculations, modeling, and analysis would be helpful.

Response: The geotechnical, seismic, and hydrogeologic data and associated field explorations are summarized in Appendix A, HB-1. Explanations are provided within that appendix to describe how the data support specific design criteria. Additional detail on which data sources and design criteria are provided in each PDI report, Appendices A HB-1 through E HB-5, has been added to Section 5.1.

7. **Figure 1.** The legend on Figure 1 labeled the locations of test pits, soil borings, geophysical borings, observation wells, and historical observation wells as "approximate" (e.g. "designation and approximate location of soil boring"). Section 3.6.2 (Following Processing) stated that "all completed soil sampling locations were surveyed by a professional land surveyor". Please confirm whether samples shown on Figure 1 are the actual, surveyed locations and update the figure as needed.

   Response: Locations of soil borings, geophysical borings, observation wells, and historic wells were surveyed. Locations of test pits are approximate and based on the proposed locations shown in the plans. The Figure 1 Legend wording has been changed to remove the word "approximate," and a note was added for the test pits.

8. **Figures 2 through 6.** The material types shown within the boring legend (fill, ice contact deposits, glacial till, quartz diorite, granite) are very hard to read. Please add a separate section to the legend that includes larger examples of each material type.

   Response: A separate, larger legend item has been added to define the different geologic layers.

9. **Figures 3, 4, 6.** The proposed cut-off wall depth alternatives are not shown on these figures. Please revise each figure to show the proposed bottom of the cut-off wall to be consistent with Figures 2, 5, and 7.

   Response: Figures 2, 5, and 7 have been updated to show the cut-off wall depth alternatives.

10. **Figure 4.** The HA20-GP-104 boring shows a granite seam around elevation 72 feet; however, this is not noted on the field logs. Please review and revise as necessary.

    Response: The HA20-GP-104 boring log at elevation 72 ft has a description for "Bedrock cored is consistent with adjacent boring HA20-GP-105." The HA20-GP-105 boring log notes Acton Granite from 110.5 ft to 112.7 ft bgs, at elevation 72 ft. The granite seam shown in HA20-GP-104 is from the HA20-GP-105 log.

11. **Appendix A, Section 2.1, Page 2.** Please define "PQ".

    Response: PQ is a core barrel designation that is part of the Roschen™ Genuine Q wireline system. The P indicates the diameter of the core, and the Q indicates the wire line drilling. A short description was added to Section 2.1.

12. **Appendix A, Section 2.1, Page 2.** Exhibit HB1-1 includes a Standard Penetration Test (SPT) energy measurement calibration. Please summarize this activity in Section 2.1 and describe how the results were or will be utilized to correct the SPT N-values. If corrected N-value are to be used, please describe the process for selecting the correction factors.

    Response: A description of the SPT energy measurement calibration has been added to Section 1. Corrected N-values were not used in the evaluation of the relative densities and consistencies of the materials encountered.

13. **Appendix A, Section 2.5, Figure HB1-1, Page 6 and Section 4.4, Figure HB1-2, Page**
    The in-text figures are blurry and hard to read. Please remove the figures from the text and add them to the end of Appendix A in a Figures section. Also, it would be helpful to show the proposed alignment of the containment wall on this figure HB1-1.

    Response: The embedded Figures were removed from the main text and included at the end of the text section accordingly.

14. **Appendix A, Section 4.1.1, Page 7**. The HB-1 PDI scope calls for collection and analysis of 15 soil samples for grain size distribution from the borings along the containment (CMT 1-6). Were these analyses completed? Exhibit HB-1 provides 12 grain size analyses from boring B-101 through 104 but these appear to be related to PDI HB-4. Please clarify.

    Response: The HB-1 PDI work plan specifies that geotechnical laboratory testing will include up to 15 grain-size distribution tests of overburden soil samples. Due to the consistency observed in the soil conditions, only 12 grain-size distribution tests were conducted, and results are summarized in Exhibit HB1-4. An explanation was added to Section 4.1.1.

15. **Appendix A, Section 4.1.1, Page 7.** It is not clear how observed soil texture and Standard Penetration Test (SPT) results are used to identify the lithology contacts presented in Figures 2 – 7. Please provide a summary of the Standard Penetration test results (e.g., corrected N-value range and average) and observed Unified Soil Classification System (USCS) texture(s) for each of the overburden layer (i.e., fill, ice contact deposits, flow till and glacial till).

Given that location of the glacial till contact will be a key design criteria for the containment performance, please describe variation in texture and N-value range that generally differentiates the glacial till from the overlying ice deposits. Please describe the differences in the flow till and glacial till and how those differences may impact containment performance.

Response: Subsurface information from additional explorations, planned to be completed during the remedial design process, will be used to better differentiate between the glacial till, flow till, and the overlying ice deposits.

16. **Appendix A, Section 4.1.2, Page 7.** For completeness, please include a summary discussion of the Rock Quality Designation (RQD) results observed in the borings.

    Response: Text has been added to Section 4.1.2 summarizing the RQD observations.

17. **Appendix A, Section 4.2.1, Page 8.** Please define/label the difference between the two rows of "Bower-Rice" estimated hydraulic conductivities shown for each well.

    Response: A footnote to clarify the differences was added to the summary table.

18. **Appendix A, Section 4.2.2, Page 8.** Please define/label the difference between the two rows of "Hantush-Jacob" estimated hydraulic transmissivity and hydraulic conductivities shown for each well.

    Response: A footnote to clarify the differences was added to the summary table.

19. **Appendix A, Exhibit HB1-1**. The borehole logs state the coordinates, top of PVC casing were not surveyed; however, Section 3.6.2 of the report text states that "all completed soil sampling locations were surveyed by a professional land surveyor". Please clarify.

    Response: The coordinates, top of PVC, and top of casing were surveyed. Elevations were added to the borehole logs.

20. **Appendix A, Exhibit HB1-1.** The geologic material type shown on the Boring Log and Well Completion Reports in the stratigraphy column are inconsistent between boring logs. Please review and edit as needed.

    Response: The boring logs and CMT logs have been updated.

21. **Appendix B, Section 2.0, Page 1.** A kinematic analysis to determine seismically induced wall bending moments was not performed as part of this PDI as stated in the text. Section 5.1 states that this analysis will be completed at some point in the future. Please clarify.

Response: Subsurface information from additional explorations, planned to be completed during the remedial design process, will be used to develop the required wall depths and width during that phase. The kinematic analysis for the wall will be performed during the 95% design phase to evaluate the wall depths and width determined during the 30% RD.

22. **Appendix B, Section 5.1, Page 5.** Given that the wall mix design/composition, thickness, and depth will be strongly dependent on the kinematic analysis, please provide a description of the process and inputs required to complete the kinematic analysis. Will a finite element model (e.g., Plexus, Sigma/W) be used? Are there inputs (i.e., elastic modulus, tensile strength) that also need to be considered in the mix selection and mix study? Please address.

Response: A finite element model (Plaxis) will be used to evaluate the wall behavior under dynamic loading from the design earthquake. Soil and wall properties including moduli, strength, unit weight, and others will be developed based on site-specific explorations and laboratory testing. Containment wall backfill properties (including elastic modulus) used in the model will be based on compressive strength determined during bench-scale testing. Tensile strength of concrete will not be measured, as reinforcement will be required if the concrete backfill will be placed in tension due to bending during dynamic loading.

23. **Appendix B, Section 5.1, Page 5.** The text refers to backfill strength. Please clarify if backfill is anticipated during wall construction.

Response: Additional detail has been added to Section 5.1. For clarification, backfill for the wall will be the proposed mix identified to meet the design criteria. In all likelihood, it will be a mixture of Portland cement, bentonite, and other materials. The wall will be constructed under slurry with 100% replacement of the excavated material.

24. **Appendix C.** The pilot scale bench study for concrete mixes for the containment wall was not completed as planned in the PDI WP. The text states that no laboratory testing was done as part of this PDI. The information presented does not include clear references of where the proposed mix designs come from and how they are similar or different from anticipated conditions at the Holding Basin. Please explain why a bench scale laboratory test was not performed to test specific mixtures and provide additional information on the mix designs presented in Section 4 (Results) and Exhibit

HB3-1.

Response: An explanation has been added into Section 1. Agency review and confirmation of hydraulic conductivity requirements summarized in Appendix E, HB-5 Seepage Analysis, is necessary before selecting mix designs for hydraulic conductivity testing. Each of the example concrete mix designs summarized in Appendix C, HB-3, is targeted for a hydraulic conductivity of approximately 1 x 10^{-8} to 1 x 10^{-6} cm/s or less.

25. **Appendix C, Section 2.1, Page 1**. Please clarify if material flexibility and longevity were considered in the evaluation of mixture additives.

    Response: In Section 2.1, flexibility and longevity were stated as parameters considered in the evaluation of mixture alternatives. Plastic concrete was selected for its flexibility and ability to reduce brittleness in the Holding Basin wall. The ROD specifies that "the containment wall and cover will be constructed to be maintained for a minimum of 200 years." Longevity details have been added to Section 2.1.

26. **Appendix C, Section 2.1, Page 1**. It is unclear how many case studies were evaluated to identify potential mix proportions. Were mix designs from eight different sources considered as listed in the text? There only appear to be results for 7 mixes presented in Exhibit HB3-1.

    Response: Multiple mix designs were considered in the literature review process. Some mix designs did not present permeability and strength results or did not provide clear constituent proportion information; therefore, they were not included in Exhibit HB3-1. The seven mix designs presented in Exhibit HB3-1 were reviewed in greater detail based on how closely the site conditions corresponded with the Holding Basin wall conditions. The number of mix designs presented in Exhibit HB3-1 was corrected from eight to seven in Section 2.1. The strength and permeability results were also considered when narrowing down the mix designs. An explanation has been added to Section 4.1.

27. **Appendix C, Section 2.2, Page 2.** Please provide additional details. How will permeability be measured in subsequent testing? Is strength defined as compressive strength? Do criteria for tensile strength need to be considered? Do stress\strain relationships need to be developed for the kinematic analysis? Are there tests that would differentiate potential for shrinkage and tension cracking of the design mix?

    Response: Permeability of bench-scale samples will be measured in general conformance with ASTM D5084 (Standard Test Methods for Measurement of Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter).

Strength of the concrete will be defined as compressive strength. Tensile strength will not be measured, as reinforcement will be required if the concrete backfill will be placed in tension due to bending during dynamic loading. If necessary, standard reinforcement will be used, and the industry standard values will be used for the properties. Stress/strain behaviors will be developed in the compressive testing of the concrete (either by laboratory measurement of strain or use of empirical relationships based on compressive strength). Shrinkage will be evaluated with the ASTM C157 method. If necessary, reinforcement will be included to reduce the risk of tension cracks using standard design ACI methods.

28. **Appendix C, Section 2.2, Page 2.** Please provide the specific properties that differentiates “plastic concrete” from “conventional concrete”.

Response: A concise summary of plastic versus conventional concrete was provided at the beginning of Section 4.1 and additional details were added. Plastic concrete consists of aggregate, cement, water, and bentonite mixed at high water to cement ratios, whereas conventional concrete does not typically include a substantial percentage of bentonite. Plastic concrete is more ductile than conventional concrete and has a higher resistance to deformation. Plastic concrete was selected as a focus for research on the Holding Basin mix design as it is a mixture with the potential to reduce permeability as well as decrease cracking and brittleness.

29. **Appendix C, Section 4, Page 3.** Please describe the literature review process and why the search was narrowed to the mixes presented in Exhibit HB3-1.

Response: See response to Comment 26. Additional information on how the search was narrowed down to seven mix designs has been added to Section 4.1.

30. **Appendix C, Section 4.1, Page 3.** Please clarify the definition of “Cement Factor”. Is it the ratio of cement to bentonite or is it the weight of cement and bentonite divided by the volume of concrete? Are the percentages of cement (4% to 12%) and bentonite (0% to 6%) the weight of cement and bentonite to the weight of concrete (including water)? Please define “coarse” and “fine” aggregate.

Response: The cement factor is equivalent to the weight of cement plus the weight of bentonite per cubic yard of plastic concrete. The equation for the cement factor under Definition 1 in the Assumptions and Definitions section of Exhibit HB3-1 has been adjusted to clarify the definition. The percentages of cement and bentonite are by weight in dry form, and water has its own percentage by weight in the calculation package. According to the Portland

Cement Association, the fine aggregates generally consist of natural sand and crushed stone (Particle size passing through 3/8-inch sieve) and coarse aggregates are any particles greater than 0.19-inch. Coarse and fine aggregate differentiation differs between mix design studies. However, the *Plastic Concrete Cutoff Walls for Earthen Dams* study stated that masonry sand and ¾-inch well-rounded gravel were used as aggregates.

31. **Appendix C, Section 4, Page 3.** A summary and discussion of the results from the seven mixes (identified in the literature search) would be helpful. A discussion of how these projects relate or differ from the Holding Basin containment would also be helpful.

    Response: An embedded table has been added into Section 4.1 which provides a short discussion of the mix designs presented in the calculation package and comparison to the Holding Basin Containment site conditions. The order of mix designs in the Section 4.1 table corresponds to the table in Page 3 of the calculation package.

32. **Appendix C, Exhibit HB3-1, Pages 1.** Please define what the subscript numbers are that are included after some of the text in the first column (Wall Mix Design) of the table.

    Response: The subscript numbers on the wall mix designs correspond to the Reference number from the list in the Calculation Sheet. Reference 1, *Plastic Concrete Cutoff Walls for Earth Dams*, contained multiple mix designs. A note has been added beneath each table clarifying the subscript number meaning.

33. **Appendix C, Exhibit HB3-1, Page 1.** Is "Cement Factor" equal to pounds of cement divided by pounds of concrete or cubic yards of concrete? Does the numerator also include the pound of bentonite? The is a typographical error "Benton=ite". Please clarify what the "Bentonite Percentage (in Cement Factor)" equals? Does this mean that 40% of the dry reagents (i.e., cement and bentonite) are bentonite?

    Response: The cement factor is equivalent to the weight of cement plus the weight of bentonite per cubic yard of plastic concrete. The equation for the cement factor under Definition 1 in the Assumptions and Definitions section has been adjusted to clarify the definition. The typographical error has been fixed. The bentonite percentage is the percentage of cement factor, by weight, which is bentonite. An equation was added under the Assumptions and Definitions section for the bentonite percentage as it relates to the cement factor. The bentonite percentage indicates that the weight of bentonite comprises 40% of the total weight of cement and bentonite in the cement factor value.

34. **Appendix C, Exhibit HB3-1, Page 2 and 3**. The sheet title is "Groundwater

Velocity Calculation". Are the strength values for rows 1 and 2 unconfined compressive strength?

Response: The sheet titles have been corrected. The strength values located in Rows 1 and 2 of the table on Sheet 3 are shear strength values and that detail has been added to the table.

35. **Appendix C, Exhibit HB3-1, Page 3**. The word "concrete" is misspelled in the last row of the table.

    Response: The spelling has been corrected.

36. **Appendix D, Section 4.3.1, Page 6.** Photographs of the test pits should be included as an attachment/exhibit to this report.

    Response: Available test pit photographs and photographs of the Gabion Wall have been compiled as an attachment.

37. **Appendix D, Section 4, Pages 7 and 8.** Please provide supporting information used to develop the soil input perimeters (e.g., density, drained strength, undrained strength) that will be used in the Slide2 simulations. What were the specific N-values assigned to each layer? Were the N-values corrected and how were they averaged across the layer thickness? What specific empirical correlations were used to develop the perimeters from the N-values?

    Response: Additional detail added to Section 4.4.1. Given the variety of the N-values in each major stratum and the high efficiency of the hammer, strength parameters were assigned to layers with similar densities and consistencies in the major strata as observed during the field explorations. The parameters developed for the design are described in HB-4.

38. **Appendix D, Section 5, Pages 7 and 8**. Please describe how pseudo static slope stability analysis will be conducted using input as described in Appendix B. What minimum factor of safety will be used for the pseudo static simulation? Will this pseudo-static simulations be conducted for both the "long term" and "short term" conditions?

    Response: Sections 5.1 and 5.2 were updated to provide clarification of the analysis to be conducted.

39. **Appendix E.** The seepage analysis only includes calculation sheets. Given the importance of the seepage analysis to the wall design, please provide a narrative describing the analysis. Is the model presented a preliminary simulation with more detailed analysis to be conducted in the design-phase?

Please describe the software and required inputs and boundary conditions. Please describe how the aquifer properties were selected. How do the hydraulic conductivity values shown on the calculation sheet compare to results from Appendix A? How was the model calibrated? The calculation sheet shows simulated water levels and observed water levels (March 2021) on a single cross section, but a more comprehensive calibration is not provided. For completeness, please provide a description of the process for sensitivity\parametric analysis.

Response: The PDI narrative is included herein with the specific details on the model calibration and sensitivity analyses conducted. A summary table of the sensitivity/parametric analyses completed is attached to the calculation package and is referenced in the PDI narrative.

40. **Appendix E, Section 5, Page 5.** The first paragraph of this section suggests that the design will only consider 2 design scenarios (shallow wall that is keyed 10 ft into till or deep wall that is keyed 5 ft into bedrock). Please clarify and edit text as necessary.

    Response: The text and figures were updated and clarified as necessary.

41. **Appendix F.** This appendix is missing. Please provide the laboratory reports in the final version of the report.

    Response: Laboratory reports have been compiled for Appendix F and they will be provided in the final version.

Please contact me if you have any questions,

Sincerely,

Bruce Thompson

Draft Holding Basin Containment Wall and Cap Pre-Design Investigation Evaluation Reports
Concord, Massachusetts

Ladies and Gentlemen:

The purpose of this letter is to transmit our initial draft of the Holding Basin (HB) Pre-Design Investigation (PDI) Evaluation Reports. The planned scope of work for these PDIs involved conducting test borings, groundwater sampling, and hydraulic testing of the subsurface soils and bedrock to better define the geotechnical engineering properties of the subsurface soils and bedrock within and around the Holding Basin. The Remedial Investigation was sufficient in its completeness to delineate the subsurface conditions along the proposed containment wall alignment and to define the soil properties within the footprint of the HB to design the containment wall and cap system anticipated to meet the Record of Decision (ROD) requirements for the remedy. As required by Section 3.3(a) of the Statement of Work (SOW), PDI Work Plans (Work Plans) were prepared and submitted to United States Environmental Protection Agency (EPA) in March 2020 to obtain the information (i.e., address data gaps) needed to complete the remedial design by conducting additional field investigations. EPA approved the PDI work plans in October 2020. PDI field activities were implemented between October 2020 and October 2021.

In accordance with Section 3.3(b) of the SOW, PDI Evaluation Reports have been prepared for the three remedial components (Site-wide Soils and Sediments, in-situ stabilization [ISS], and HB Containment). This report provides the five PDI evaluation summaries (HB-1 through HB-5) for the Holding Basin Containment Wall and Cap.

Please feel free to contact us should you have any questions or if you need additional information.

Sincerely yours,
HALEY & ALDRICH, INC.

List of Figures

1. Introduction

On 17 October 2019, the United States Environmental Protection Agency (EPA) lodged a Consent Decree (CD) with the United States District Court for the District of Massachusetts Eastern Division in connection with Civil Action No. 1:19-cv-12097-RGS. The CD was entered by the Court on 6 December 2019. The CD and the Statement of Work (SOW) provided as Appendix B to the CD describe the Remedial Design/Remedial Action (RD/RA) activities to be performed for the Nuclear Metals, Inc. (NMI) Superfund Site (Site) in Concord, Massachusetts. The RD/RA activities are to be undertaken by the Settling Defendants (SDs) to the CD, with funding contributions from the Settling Federal Agencies (SFAs).

To efficiently implement the remedy, the work will be divided five RA projects. RA Projects 1) through 4) below are outlined in Section 1.4 of the SOW. The need for RA Project 5) was identified during the Groundwater Non-Time-Critical Removal Action (NTCRA). The five RA projects are:

1) excavation and off-site disposal of contaminated sediments, underground drain lines and debris, and non-Holding Basin (HB) soil, or “Site-wide Soils and Sediments” (SSS);
2) in-Situ Stabilization (ISS) of depleted uranium (DU) in HB soil and of DU and natural uranium in overburden and bedrock groundwater or “ISS;”
3) containment of HB-stabilized soil with a low-permeability vertical wall and horizontal sub-grade cover or “HB Containment;”
4) hydraulic containment and ex-situ treatment of volatile organic compounds (VOCs) and 1,4-dioxane in overburden groundwater; and
5) hydraulic containment and ex-situ treatment of volatile organic compounds (VOCs) and 1,4-dioxane in bedrock groundwater.

The Remedial Investigation (RI) was sufficient in its completeness to delineate the nature and extent of contamination such that risks to human health and the environment could be quantified and remedial decisions could be made. However, the RI was not intended to provide all of the information necessary to design a remediation. Therefore, as required by Section 3.3(a) of the SOW, Pre-Design Investigation (PDI) Work Plans (Work Plans) were prepared and submitted to EPA in March 2020 to obtain the information (i.e., address data gaps) needed to complete the remedial design by conducting additional field investigations. EPA approved the Work Plans in October 2020. PDI field activities were implemented between October 2020 and October 2021.

In accordance with Section 3.3(b) of the SOW, PDI Evaluation Reports have been prepared for the three remedial components (Site-wide Soils and Sediments, ISS, and HB Containment). This report provides the five PDI evaluation summaries (HB-1 through HB-5) for the Holding Basin.

1.1 PERFORMANCE STANDARDS

The Record of Decision (ROD) provided Remedial Action Objectives (RAOs), which are medium-specific goals that define the objective of remedial actions to protect human health and the environment. RAOs specify the chemicals of concern (COCs), potential exposure routes and receptors, and provide a general description of what the cleanup will accomplish. The RAO that is relevant for the majority of the HB remedial design and related PDI work is:

Prevent migration of DU/uranium from soils in the Holding Basin that would result in groundwater concentrations exceeding ARARs [Applicable and Relevant Requirements];

An additional RAO is also relevant to the stability analyses conducted as part of HB-4 that will be used for the Sphagnum Bog and Cooling Pond remedial actions:

Protect ecological receptors from exposure to contaminants (PCBs, copper, mercury, and lead) in sediments indicative of adverse effects at the Sphagnum Bog while maintaining the physical and ecological integrity of the bog.

The ROD specifies that the remedy must include containment of the stabilized soils with a low-permeability vertical wall and horizontal cover to isolate the stabilized soil and limit mobility of contaminants through groundwater. In addition to meeting the groundwater ARARs as noted in the RAO, the remedy must also meet the Nuclear Regulatory Commission regulation 10 Code of Federal Regulations (CFR) Part 40, Appendix A, Criterion 6(1), which is considered an applicable ARAR. As described in the Remedial Design Work Plan (RDWP), the relevant aspect of this ARAR is that the containment wall and cover will be constructed to be maintained for 1,000 years to the extent reasonably achievable and in any case for a minimum of 200 years. This means the containment wall will also need to be designed to withstand a design earthquake.

The activities conducted as part of PDI HB-1 through PDI HB-5 were intended to provide data to support a design that will meet the standards described in the ARARs.

1.2 DOCUMENT ORGANIZATION

The HB PDI Evaluation Report includes:

- a summary of the PDI scope and objectives (Section 2)
- a summary of the PDI implementation activities (Section 3)
- documentation of data management and validation (Section 4), and
- next steps in the remedial design process.

Appendices A through E provide documentation of the PDI activities for HB-1 through HB-5, respectively.

2. PDI Objectives

This Holding Basin (HB) Pre-Design Investigations (PDI) Summary Document provides a brief review of the various site areas, objectives and scopes of the work associated with the completed HB PDI investigations. This document also provides a summary of implementation procedures conducted during PDI activities, which were performed consistently over multiple HB activities. Haley & Aldrich, Inc. (Haley & Aldrich) completed the work in accordance with the RDWP and all appendices, including the Work Plans, the Field Sampling Plan (FSP), and the Quality Assurance Project Plan (QAPP).

More detailed descriptions of individual HB PDI activities completed, included location identifications and associated investigation results, and remedy design considerations are provided in the attached HB appendices.

2.1 HB-1 HOLDING BASIN GEOTECHNICAL INVESTIGATIONS – SOIL AND BEDROCK

The objective of PDI HB-1 was to collect geotechnical and hydrogeologic data at the HB to support the design of the containment wall. Details of the investigations and results for this PDI are included in Appendix A.

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin	Collect geotechnical, seismic, and hydrogeologic data necessary to design a containment wall that prevents depleted uranium (DU) from migrating downgradient and meets the applicable or relevant and appropriate requirements (ARARs).	• Boring installation along the alignment of the cutoff wall into bedrock to evaluate soil density and bedrock characteristics by conducting standard penetration tests (SPTs) throughout the overburden of each of these borings, and coring bedrock for laboratory testing to aid in the design of the containment wall and construction methods. • Borehole geophysics to evaluate water bearing zones and bedrock fracture orientation. • Installation of continuous multi-level tubes (CMTs) to gain multi-level piezometric head and groundwater quality information to support hydraulic design of the containment wall and evaluating ARARs. • Observation wells (OWs) installation within bedrock boreholes located adjacent to the deep CMTs to allow for slug testing and short duration pumping to observe response in CMTs and other OWs. • Geotechnical Laboratory testing: grain size tests on overburden soils, compression strength tests on rock core, and Cerchar Abrasivity tests on rock core. • Conduct research on pump house foundation and utility alignments into pump house and conduct test pits to confirm utilities and structures (i.e., pump house slabs) that may need to be removed to enable wall construction or other adjacent remedial actions.

2.2 HB-2 SEISMIC ANALYSIS FOR CONTAINMENT WALL

The objective of this PDI was to collect information on seismic conditions to support the design requirements of 10 CFR Part 100 as well as 10 CFR Part 40. Based on 10 CFR Part 100, the closure remedy will be designed to withstand the Safe Shutdown Earthquake (SSE), including an assessment of the potential for surface deformation and faulting, liquefaction potential, and stability of the adjacent slope extending downward to the bog. This analysis will be conducted as part of the 30% RD and presented with the proposed containment wall design and cap design.

Details of the investigations and results for this PDI are included in Appendix B.

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin	Conduct Seismic Evaluation for Holding Basin Wall Design	• Drill six bedrock boreholes for cross-hole geophysics, forming two sets of 3-hole arrays for the geophysics. • Field shear wave measurements using cross-hole geophysical methods to characterize soil and bedrock to support the probabilistic seismic analysis to meet seismic design applicable or relevant and appropriate requirements (ARARs). • Conduct seismic analysis, determine design loads for containment wall in accordance with ASCE-7 design standards, and perform structural design of wall to resist design earthquake.

2.3 HB-3 BENCH SCALE TESTING OF SLURRY AND CONTAINMENT WALL MIX DESIGNS

The objective of this PDI was to evaluate potential containment wall mix designs.

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin	Identify mix design information in support of a performance-based specification for the barrier wall construction. Assist contractors with selection of materials and mix designs as they prepare bids for barrier wall construction.	• Identify potential type and percentage of bentonite to be used in slurry for temporary support of excavated panels for containment wall • Evaluate potential concrete backfill mix designs to satisfy minimum required permeability and strength criteria • Evaluate mix design materials and their potential interactions with radiologically impacted media

Hydraulic conductivity is a critical aspect of the containment wall design, and information is needed on the ranges of hydraulic conductivities achievable using slurry wall construction methods with different mix designs. The mix designs will also be used to verify that the design will meet the required changes to depleted uranium migration in groundwater over the time frame stipulated in 10 CFR Part 40.

Agency review and concurrence on proposed hydraulic conductivity requirements summarized in Appendix E, HB-5 Seepage Analysis, is necessary before finalizing mix design selections and completing hydraulic conductivity testing. As such, a literature review of types of mixes and range of hydraulic conductivity achieved is included within this report but laboratory testing on the proposed mix designs has not yet been conducted.

Details of the literature review and recommendations for the mix designs to be tested for completion of this PDI are included in Appendix C, HB-3 - Slurry Wall Mix Designs for Bench Scale Testing .

2.4 HB-4 COVER DESIGN AND SLOPE STABILITY ANALYSIS

The purpose of this PDI was to investigate the geotechnical properties of sloped areas of the site under existing conditions and future conditions with conceptual level future grading of the HB and Landfill areas. Existing slopes in some areas of the site pose risk for slope failure or limit access for equipment during investigatory activities and future remedial activities, including around the HB, the Cooling Pond (including the gabion wall at the northern end), and the Sphagnum Bog. Maintaining stable slopes with adequate safety factors is critical for executing the selected remedial actions outlined in the ROD.

Details of the investigations and results for this PDI are included in Appendix D.

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin Cover and Side Slopes of Cooling Pond and Sphagnum Bog Areas	Cover Design and Slope Stability Analysis	• Complete up to four borings into Holding Basin to collect geotechnical data necessary for cover system design. • Complete hand probes to determine organics thickness within Sphagnum Bog, and soft sediment thickness of sediments in Cooling Pond. • Complete hand probes along slopes adjacent to the Holding Basin and Cooling Pond to evaluate near surface soil conditions. • Collect field vane shear measurements on organics located within the bog. • Complete two test pits behind the gabion wall south of the Cooling Pond to evaluate the wall cross-section. • Conduct plumbness survey of the gabion wall face at up to two transects. • Conduct slope stability analysis for proposed finished grades of Holding Basin Cap and adjacent side slopes, and side slopes adjacent to bog and Cooling Pond.

2.5 HB-5 SEEPAGE ANALYSIS

The purpose of this PDI was to evaluate the various alternative containment wall design depths and the resulting seepage potential within the overburden and bedrock aquifers. The analysis and results from this PDI will be used to inform the design of the hydraulic and physical properties of the proposed containment wall. The analysis presented in this PDI includes evaluating the containment wall keyed into glacial till or bedrock. The analysis includes several variations to the wall depth and thickness to determine the appropriate range of design parameters for the wall to meet the design criteria.

Details of the investigations and results for this PDI are included in Appendix E.

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin	Complete seepage analysis to evaluate hydraulic properties of wall and determine depth of wall.	• Setup SEEP/w model with overburden and bedrock aquifer geometry using hydraulic conductivity values from Geosyntec calibrated groundwater flow model as well as data gathered in PDI HB-1. • Conduct parametric seepage modelling on proposed wall depths and wall hydraulic conductivity to refine design parameters of containment wall.

3. Implementation Summary

3.1 ACCESS

PDI work was conducted within several site areas, and across varying field conditions, some of which were challenging to access. Conditions at sampling locations included the following: wooded uplands, steeply sloped wooded areas, at the bottom of steep slopes, areas adjacent to wetland, in wet areas along wetland fringes, within wetlands with soft sediment present, and near areas of standing water.

Prior to sampling, each proposed sampling location was located either using a hand-held GPS unit or by Feldman Surveyors, the project survey team, and each location was reviewed for access and general field condition considerations. Pre-decontaminated ("clean") or new sampling equipment, supplies, glassware, etc. was mobilized to each sampling location, either carried by hand or transported using a wagon sled or using a field vehicle depending on accessibility. Routes to proposed sampling locations were reviewed to follow general project guidelines related to different zones to be established at the site (e.g., Contaminated Soil Zone, Contaminant Reduction Zone, etc.). Actual routes and paths through wooded areas were determined to most safely access each sampling location, with least disturbance to the surrounding area. Very limited clearing such as clearing of branches, brush, leaves, etc. was necessary to access some the locations and to create individual sampling areas. Disturbance to surficial soils was limited.

If applicable, all equipment and tools which entered the restricted area was subject to screening by a health physicist (HP) according to the Radiological Surveys Health Physics Procedure (HPP; HP-NMI-05 in the Field Sampling Plan [FSP], RDWP Appendix I) to determine if background levels of radiation exist on the equipment prior to exposure to on-site soils. To Haley & Aldrich's knowledge, background levels of radiation were not detected on equipment prior to exposure to Site soils. Additionally, disposable barriers were applied as directed by the on-site HP or Radiation Safety Officer (RSO) to prevent contaminating equipment and tools while in the restricted area. One example of this was where the HB PDI work for borings conducted within the HB. Access down the steep slope was difficult and required a temporary handrail that was at the top of the HB. The top post of the handrail functioned as the exclusion zone marking prior to enter or exiting the HB.

Before entering the restricted area, workers reviewed and signed the specific radiation work permits for drilling and soil sampling activities, donned the required personal protective equipment (PPE) and monitoring equipment as specified in the radiation work permit and/or instructed by the RSO or HP. Prior to initiating work, the staff consulted with the HP and RSO to determine an approach for screening and transporting equipment to the decontamination area and back so that work can progress efficiently.

For locations where a drill rig was utilized, the driller created an exclusion zone around the drill rig, typically consisting of cones and roped off. Only the driller,driller's helper, Haley & Aldrich field geologist, and RSO Personnel entered the exclusion zone. The borings completed along the alignment of the containment wall were in non-wooded areas and required an exclusion zone consisting of a Table for only the field geologist and RSO personnel as well as the driller and helper to provide collected samples of soil or rock core.

3.2 SOIL SAMPLING AND BEDROCK CORE DRILLING

As part of the PDI work the multiple borings were completed through overburden and bedrock. Borings were completed in accordance with the following ASTMs:

- ASTM D1586 for SPT of the soils;
- ASTM D2488 for the visual description methods for describing the soils;
- ASTM D2113 for rock coring methods; and
- ASTM D6032 for rock quality designation (RQD) measurement methods.

Geotechnical laboratory testing included 15 grain size tests of overburden soil samples, 15 compression strength tests on rock cores, and 8 Cerchar abrasivity tests on rock cores. Testing was performed in accordance with the following ASTM International Standards:

- ASTM D6913/D6913M-17: Standard Test Methods for Particle Size Distribution (Gradation) of Soils Using Sieve Analysis
- ASTM D7928-17 Standard Test Method for Particle-Size Distribution (Gradation) of Fine-Grained Soils Using the Sedimentation (Hydrometer) Analysis
- ASTM D7012-14e1: Standard Test Methods for Compressive Strength and Elastic Moduli of Intact Rock Core Specimens under Varying States of Stress and Temperatures
- ASTM D7625-10: Standard Test Method for Laboratory Determination of Abrasiveness of Rock using the CERCHAR Method.

3.3 CROSSHOLE SEISMIC BORING INSTALLATION

The procedures of ASTM D4428 require cased boreholes, and the casing is specified to be either PVC or aluminum. The boreholes were completed by installing 3-inch (in.) ID PVC Schedule 40 casing, in each of the boreholes of each crosshole array. The cross-hole borehole locations are shown on Figure 1 and are spaced 12 to 15 feet (ft) apart. Prior to conducting the cross-hole testing, a deviation survey was completed by Geophysical Applications, Inc.

The completed boreholes were drilled by Cascade Drilling, and met the following requirements:

- The cased boreholes were confirmed to be sufficiently straight to allow free passage of a cylinder 2.5 in. in diameter by 52 in. long. (This requirement ensures that the downhole source passes freely through the casing.)
- The casings were capped and grouted for the full depth of the boreholes in accordance with ASTM D4428. Rigid grout was utilized within bedrock, and non-rigid grout was used within the overburden section of the boreholes.
- Prior to the testing, the boreholes were filled with potable water.

3.4 SHALLOW SOIL SAMPLING

For surficial soil (0 to 1 ft), sampling was completed using a hand auger or other hand-held excavation device such as a shovel or hand trowel. Samples were collected by advancing an approximate 4-in. diameter stainless steel hand auger to a 1 ft depth, or by manually hand excavating explorations using a shovel and/or hand trowel to a minimum dimension of approximately 6 in. wide by 6 in. long to 1 ft depth. Soil samples were collected from the hand auger or from the side walls of the explorations, compositing the entire 1-ft depth interval in a disposable aluminum pan. The volume of collected material was stirred to homogenize the sample and then placed in appropriate glassware for submission to the laboratory.

The general drilling soil logging and sampling activities were conducted in accordance with SOP NMI-S-004 – Drilling and NMI-S-006 – Soil Description. Additional procedures related to radiological screening of the soil cores and coordination with the HP and RSO have been outlined above.

Upon completion, explorations in softscape areas were backfilled with soil cuttings and explorations in pavement areas were backfilled with crushed stone and the ground surface was restored or graded to approximate existing surrounding conditions. Excess soil cuttings not used for analytical soil samples or backfill were containerized and transported to the storage drum containment area. The borings conducted within the HB were grouted flush with ground surface, and the liner was patched.

3.5 GROUNDWATER SAMPLE COLLECTION

Groundwater sampling conducted as part of the HB PDI work was performed using low-flow methodology as outlined in the EPA Low-Stress (Low-Flow) Standard Operating Procedure EQASOP-GW4. A copy of the NMI-GW-010 is included in the FSP.

Field instruments were inspected and calibrated at the beginning of each day and checked during field activities to verify performance. Instrument specific calibration procedures were performed in accordance with the instrument manufacturer’s requirements.

During low flow purging, a multi-parameter meter was used to measure pH, specific conductivity, turbidity, dissolved oxygen, oxidation reduction potential (ORP) and temperature. Readings were collected at 5-minute intervals and recorded on field logs. Once the parameters were stable, the samples were collected into laboratory provided glassware.

Samples were submitted to Alpha Analytical Labs in Westborough, Massachusetts (a National Environmental Laboratory Accreditation Program [NELAP] accredited laboratory) and GEL Laboratories in Charleston, South Carolina. VOCs, semi-volatile organic compounds (SVOCs), and nitrate/nitrite were analyzed by Alpha Analytical Labs. VOCs were analyzed by EPA method 8260C, SVOCs were analyzed by EPA Method 8270D, and nitrate and nitrite were analyzed by EPA Method 353.2. Metals were analyzed by GEL Laboratories using EPA Method SW 846 3005A/6020B. The chemicals of concern analyzed are outlined in Table L-1 of the ROD and listed below.

- 1,1-Dichloroethane
- Tetrachloroethene
- Trichloroethene
- Vinyl chloride
- 1,4-Dioxane
- bis(2-Ethylexyl)phthalate
- Arsenic
- Barium
- Chromium
- Cobalt

- Copper
- Iron
- Manganese
- Molybdenum
- Thorium
- Depleted Uranium
- Natural Uranium
- Nitrate
- Nitrite

Additional samples were submitted for quality control, as summarized in QAPP (Appendix J of the RDWP). Quality control samples were analyzed for all parameters analyzed during sampling events.

3.6 FIELD SAMPLE PROCESSING

3.6.1 Prior to and During Processing

At each land-based soil or bedrock sample location, polyethylene sheeting was placed to create a small, dedicated area to temporarily stage sampling equipment and supplies, and to process the samples. For sediment samples collected in wet areas (within or adjacent to wetlands, or in pond), sediment was collected at the sample locations, then transported to a safe location at a dry, stable area for sample processing.

Small sample processing areas were also constructed at either each drilling/sampling location to process soil samples collected by the drilling rigs, or at centralized locations used to facilitate drilling/sampling at several locations.

For activities where a drill rig was used, after work areas and processes were established, drilling commenced with continuous sampling. Soil cores were extracted and carried to the logging area by the driller or the driller's helper. The borings were advanced, and the soil cores were extracted until the final depth of the boring was reached. If the driller proceeded faster than the field engineer or geologist could process samples, the soil cores were staged in liners at the logging area. After a soil core had been set in the logging area, the core liner was cut open and logged by the field engineer or geologist using the Unified Soil Classification System (USCS) and following the soil description SOP (NMI-S-006, in the FSP).

Refer to the applicable project specific FSP (Appendix I of the RDWP, de maximis, September 2020), the Standard Operating Procedures (SOPs) located as Appendix I 1 of the FSP, QAPP (Appendix G of the Remedial Design Work Plan, de maximis, September 2020) for further details related to protocols for sample processing, glassware, preservation, chains of custody, decontamination, and field documentation requirements and procedures for sample collection activities. Sampling was conducted in general accordance with the FSP, SOPs and QAPP, discussed above.

3.6.2 Following Processing

After sample processing was completed, the dedicated sampling equipment was bagged for disposal and the remaining equipment was decontaminated prior to reuse. Refer to the Investigative Derived Waste

(IDW) Handling and Storage (SOP NMI-005) and Field and Heavy Equipment Decontamination Procedures (SOP NMI-007) SOPs for additional details related to those items.

Following completion of the sampling, the completed as-sampled locations were marked with a flag or wood stake with flagging attached. Subsequently, all completed soil sampling locations were surveyed by a professional land surveyor. Note that sediment samples were collected immediately adjacent to corresponding piezometer locations, therefore locations were not marked nor surveyed separately.

If applicable, each time staff and/or equipment left a restricted area, it was screened out of the restricted area under the guidance of the HP following the Personnel Monitoring and Decontamination HPP (HP-NMI-06, in the FSP) and signed out of the specific radiation work permit. All waste and PPE generated during the field event was bagged appropriately, handled and dispose of directed by the RSO and described in the IDW handling and storage SOP (NMI-5 in the FSP) and Radioactive Waste HPPs HP-NMI-19 and HP-NMI-27 in the FSP.

3.7 FIELD SAMPLE SCREENING

Prior to further handling, soils were initially screened with a handheld radiation survey instrument to ensure radiation levels are at a level where the core is safe to handle as determined by the HP and approved by the on-site RSO. Once the soil was deemed safe by the HP or RSO to handle without further controls, the soils were logged by the field engineer or geologist and following the soil description SOP (NMI-S-006, in the FSP). After logging, the soil core was screened again using the handheld radiation survey instrument by the HP, and the count rate per minute was logged.

At the end of the sampling day, all soil samples collected were screened by the onsite Radiological Laboratory to determine the concentration and total radioactivity prior to shipment. Gamma spectroscopy was be used to identify the isotope and assign activity present in each sample. The samples were grouped to comply with Department of Transportation (DOT) and International Air Transport Association (IATA) guidelines. The screening data was also provided to the receiving laboratory for approval prior to shipment.

3.8 IDW MANAGEMENT

IDW generated during the surficial, subsurface and supplemental delineation sampling included soil cuttings from subsurface explorations. IDW management and waste stream documentation was handled through *de maximis.* Excess soil was placed back within the hand exploration and/or borehole completed to the extent possible. Excess soil cuttings were drummed for future disposal in accordance with the Transportation and Off-Site Disposal Plan dated 21 October 2021. Excess groundwater was containerized, treated on-site, and discharged to the Cooling Pond.

4. Data Validation

Data validation was conducted in conformance with the QAPP (Worksheet #34 to #37) to assess the data usability such that deficiencies in the data and potential impacts to the results were identified. Data validation was performed by ddms, Inc. following receipt of the laboratory data reports from GEL Laboratories, LLC. Laboratory reports are provided as Appendix F. Appropriate qualifiers codes, as defined in the EPA National Functional Guidelines, were amended to the data points in the database. The data validation reports are available on the Project Portal and the original laboratory data reports have been archived.

5. Next Steps

5.1 DESIGN COMPONENTS

Data generated during the HB PDI will be used as the basis for the 30% Remedial Design (RD) of the Containment Wall and cap system for the Holding Basin. The data presented herein is intended to supplement the Conceptual Site Model of the site and to provide a refined understanding of the soil and bedrock conditions along the alignment of the HB containment wall. Geotechnical, seismic, and hydrogeologic data and associated field explorations are summarized in Appendix A, HB-1. On-going analysis as part of the 30% RD includes a summary of ground motion parameters of the bedrock and shear wave measurements from the cross-hole geophysics that will be used to complete a kinematic analysis of the proposed containment wall (Appendix B, HB-2), additional stability analyses (Appendix D, HB-4), and additional seepage model runs to support the design (Appendix E, HB-5). Figure 1 shows the completed explorations around the HB. Figures 2 through 7 show geologic sections through the HB in the orientation shown on Figure 1.

While the PDI Evaluations further defined the subsurface conditions, it is anticipated that some additional test borings along the wall alignment as part of the design process will be conducted to define the toe elevation of the containment wall. Based on the seepage analysis located in Appendix E, HB-5, the wall can be embedded 5 ft into the glacial till, 10 ft into glacial till or to top of bedrock, or 5 ft into bedrock in order to achieve adequate cut-off; however, the glacial till is less than 10 ft thick on the northeast side of the HB. In this area, the wall is expected to extend into the top of the rock. The limits of wall embedment into bedrock will be important to define between the 30% RD and the 90% RD.

As outlined in the specific PDI Summary Appendices (Appendices A through E) the data collected as part of the Holding Basin PDI work is compiled herein to facilitate the completion of the 30% RD. Because of the complexity of the Site and the necessary coordination with the scheduled ISS work, the sequence of construction of the HB containment wall will be determined based on the ISS schedule. Grading of the HB will be required, and that preliminary grading plan will be part of the site wide soil design, as that portion of site construction is expected to begin before the implementation of the ISS remedy is completed within the HB limits. For example, soil removal from the center of the plume will enable injections related to ISS to be conducted more easily. In addition, regrading of the holding basin as part of the soil removal remedy will enable access to steeper side slopes of the holding basin by the ISS injection equipment. The design drawings for the Site-wide soils and sediment, coupled with the ISS and containment wall and cap are expected to include the following drawing sets to allow for separate phases of construction to complete the entire remedy:

- AOI 8 and 9
- Courtyard Area and Building D (Plume Core)
- Building E and Regrading of Holding Basin
- Landfill and Wetlands
- ISS in Holding Basin and Plume Core Areas (Design by Geosyntec)
- Containment Wall and Cap
- Cooling Water Pond and Gabion Wall Stabilization
- Building A and D, and North Lot Restoration

5.2 DESIGN SCHEDULE

The initial grading of the Holding Basin will be included in a design drawing set for the excavation of the footprint of Building E. This part of the remedy will include segregating soils from Building E for off-site disposal and for on-site reuse to establish the grades required for the construction of the HB Containment Wall. This will allow an early action construction activity to enable ISS to be conducted within the HB.

APPENDIX A

HB-1 - Geotechnical and Hydrogeologic Investigations for Containment Wall and Cap

PDI HB-1: Investigation of Holding Basin Footprint and Containment Wall Alignment

1 Scope of Work

The planned scope of work for this Pre-Design Investigation (PDI) for the holding basin (HB) involved collecting subsurface data needed to design the HB containment wall and the low hydraulic conductivity cap to meet the HB specific remedial action outlined in the Record of Decision (ROD). Activities performed in accordance with the HB PDI Work Plan (Work Plan) to meet the objectives of this PDI include:

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin	Collect geotechnical, seismic, and hydrogeologic data necessary to design a containment wall that prevents depleted uranium (DU) from migrating downgradient and meets the applicable or relevant and appropriate requirements (ARARs).	• Boring installation along the alignment of the cutoff wall into bedrock to evaluate soil density and bedrock characteristics by conducting standard penetration tests (SPTs) throughout the overburden of each of these borings, and coring bedrock for laboratory testing to aid in the design of the containment wall and construction methods. • Borehole geophysics to evaluate water bearing zones and bedrock fracture orientation. • Installation of continuous multi-level tubes (CMTs) to gain multi-level piezometric head and groundwater quality information to support hydraulic design of the containment wall and evaluating ARARs. • Observation wells (OWs) installation within bedrock boreholes located adjacent to the deep CMTs to allow for slug testing and short duration pumping to observe response in CMTs and other OWs. • Geotechnical Laboratory testing: grain size tests on overburden soils, compression strength tests on rock core, and Cerchar Abrasivity tests on rock core. • Conduct research on pump house foundation and utility alignments into pump house and conduct test pits to confirm utilities and structures (i.e., pump house slabs) that may need to be removed to enable wall construction or other adjacent remedial actions.

By completing the outlined scope of work, Haley & Aldrich, Inc. (Haley & Aldrich) was able to obtain the following information:

- Characterization of the groundwater flow within the overburden and fractured bedrock within the proposed containment wall area.
- Characterization of the geotechnical parameters of the overburden and bedrock by collecting soil and rock samples for grain size distribution testing of the soil, and abrasivity and compressive strength testing of the rock.
- Determination the geophysical properties of the bedrock and identification of the location and orientation of water bearing zones and fractures within the bedrock.
- Determination of the depth and extent of the glacial till stratum, the depth to bedrock within the proposed HB containment wall as well as measurements of the hydraulic conductivity of each discrete zone of overburden soils and bedrock.
- Characterization of groundwater quality data within each discrete zone including the overburden soils and bedrock within the HB containment wall area.

- Evaluation of the presence of subsurface structures associated with the pump house which may need to be removed to enable wall construction or other adjacent remedial actions.
- Characterization of soil density and stratigraphy below the footprint of the HB to evaluate the potential for settlement of subgrade soils due to the loading of the fill section to grade the footprint of the HB to construct a cap. *Note: this is touched on briefly within this report but covered in more detail within the HB-4 Summary.*

Data collected during this PDI will be used to design the containment wall thickness, depth, alignment, and constructability. Data obtained during HB-1 investigations will also be used to evaluate alternative designs of the final grading and cap design.

2 Summary of Work

This PDI included:

- Drilling of six (6) investigation borings and installation of CMTs within the six (6) completed boreholes;
- Installation of four (4) observation wells;
- Completion of a series of laboratory tests to evaluate soil and bedrock conditions;
- Drilling of six (6) boreholes for two (2) transects of cross-hole seismic testing;
- Collection of borehole geophysics data from eight (8) of the drilled boreholes (a combination of the locations completed for CMTs and center location of each of the cross-hole seismic testing transects); and
- Completion of three (3) test pits to confirm the limits of the former pump house.

The locations of the explorations are shown on Figure 1 of *HB Summary Report* and Table HB1-1 provides a summary of the depth and type of well installation for each location.

2.1 TEST BORING DRILLING

To evaluate subsurface geologic and geotechnical conditions, borings were advanced 20 to 50 feet (ft) into bedrock from October 2020 through January 2021 around the perimeter of the HB. Test borings were also drilled within the HB to depths ranging from 30 to 60 ft below ground surface.

Boreholes were advanced using sonic drilling methods in the overburden and bedrock of each borehole. Overburden soil was logged continuously in a 6-inch (in.) borehole and SPT was performed using split spoons to make a qualitative assessment of soil density. The SPT data was collected using a calibrated auto-hammer. The SPT data was not needed to be adjusted as the autohammer showed that the energy transmitted was typically within 87% of the SPT test of a 30 inch drop of a 140 lb. weight. Overburden samples were collected for grain size distribution testing.

Sonic drilling was performed with a PQ diameter (Roschen™ Genuine Q wireline system core barrel designation) wireline barrel, which yields 3.3 in. diameter bedrock cores. Bedrock was cored to evaluate rock characteristics and measure rock quality designation (RQD) for every core-run, which was at 5 ft intervals. Bedrock was cored up to 20 ft in three (3) of the borings and up to 50 ft in three (3) of the borings. Two (2) of the six (6) cross-hole seismic boreholes were also advanced in the same methods as described above. The other four (4) cross-hole borings were advanced to the prescribed depths using sonic drilling methods. Rock cores were preserved for geotechnical testing including unconfined compression strength tests and Cerchar abrasivity tests. The rock core testing was performed by Geotesting Express of Acton, Massachusetts.

The following borings were installed during the HB-1 PDI work: HA20-CMT-1 through HA20-CMT-6, HA20-GP-101 through HA20-GP-106, HA20-GP-102A, and HA20-B101 through HA20-B104. Locations of the borings are shown on Figure 1 of *HB Summary Report*, and boring logs and the SPT auto-hammer calibration records are in included in Exhibit HB1-1.

2.2 GEOPHYSICS FIELD COLLECTION

A borehole geophysical survey was conducted from October 2020 through January 2021 in eight (8) completed boreholes (HA20-CMT-1, HA20-CMT-2, HA20-CMT-3, HA20-CMT-4, HA20-CMT-5, HA20-CMT-6, HA20-GP-102A, and HA20-GP-105). The geophysical survey was conducted by Geophysical Applications, Inc., and consisted of lowering a series of downhole tools to the bottom of the exploration. Borehole logs are included in Exhibit HB1-2.

These tools measured the characteristics of the borehole and characterized the depths and orientations of bedrock fractures. The tools included: a fluid temperature (FTemp) sensor, fluid resistivity (FRes) sensor, three-arm mechanical caliper, optical televiewer, acoustic televiewer, and heat-pulse flowmeter.

The fluid-property logs were recorded by sensors (Mt. Sopris model 2FSB-1000) mounted on the bottom of a caliper probe (Mt. Sopris model 2CAA-1000), during the first logging run down each borehole. Fluid properties were recorded while lowering the probe at a cable speed of 5 ft per minute; the caliper log was recorded at a speed of 12 ft per minute.

Optical televiewer imaging was performed using an Advanced Logic Technology (ALT) model OBI40 MkIV optical televiewer probe. This device provides a full-color digital image of the borehole's interior, oriented with respect to both vertical and magnetic north. The OBI40 image was recorded using a vertical sampling interval of 0.007 ft, with one pixel for each degree of arc around the borehole's interior. The images from the optical televiewer allowed for viewing of geologic elements that exhibit contrasting colors (e.g. bedding bands of light or dark-colored minerals, or iron-oxide staining at hydraulically-active bedrock fractures).

Acoustic televiewer imaging was performed using an ALT model ABI40 acoustic televiewer probe. This device imaged the interiors of the bedrock boreholes via ultrasound pulses. ABI40 images were interpreted to measure the dip angle and down-dip azimuth of both tight and physically open planar features (bedding, joints, and fractures) encountered within each bedrock borehole.

Flowmeter testing was performed using a Mount Sopris model HPF-2293 heat-pulse flowmeter probe. This device heated a small volume of water that served as a tracer pulse. The length of time needed for the warm water to pass a thermistor mounted above or below the heating element, allowed calculation of the flow rate in gallons per minute (gpm). Flowmeter measurements were performed during ambient (non-pumping) conditions to identify transmissive fractures encountered by the bedrock boring that exhibit differing hydraulic head. The measurements were repeated under pumping conditions to identify fractures that contribute to groundwater recharge in each borehole. Flowmeter testing was performed at depths near hydraulically active fractures, which were determined based on results of the fluid-property, caliper, and acoustic televiewer logs.

The data collected from the survey was used to identify the location of hydraulically dominant fracture zones, and define the nature, extent, and orientation of fractures. This data was used to determine the intervals to screen observation wells and CMT intervals in each borehole.

2.3 CMT WELL INSTALLATION

Solinst CMTs wells were installed from 10 December 2020 through 15 January 2021 in six (6) of the boreholes (HA20-CMT-1 through HA20-CMT-6) following completion and interpretation of the geophysical survey described in Section 2.2 and prior to completing the remaining cross-hole seismic boreholes. The CMT installation logs are included in Exhibit HB1-3.

Each CMT well was installed with three (3) to seven (7) ports. Locations of the ports in the bedrock were based on the results of the geophysical survey such that the ports were installed within the hydraulically active fracture sets. In addition, some ports were placed in the overburden based on previously observed geologic conditions. Dual CMT ports, where one port is used to monitor water level and the other is equipped with dedicated tubing for groundwater sampling within the same geologic unit, were installed at some locations. CMT wells were constructed using a stainless-steel mesh surrounding the opening port, secured with clamps, and backfilled with a sand pack. CMT well installation was performed by a Trained CMT Contractor as certified by the manufacturer. The driller that completed the work is Cascade Environmental Drilling, and the personnel onsite were certified CMT installers. Table HB1-1 provides a summary of the installed CMT channels, including the formation screened and the elevation of each channel.

As there is no conventional well screen in the CMTs, each port needed to be developed to establish a hydraulic connection with the formation. Each CMT port was developed prior to sampling using a peristaltic pump, a mini-inertial pump, or similar.

2.4 OBSERVATION WELLS

Four (4) observation wells were installed between 8 January 2021 and 16 January 2021. Three (3) completed boreholes were used for the wells (HA20-CMT-3(OW), HA20-CMT-5(OW), and HA20-CMT-6(OW)) with each located adjacent to the three (3) deeper CMT instrumented boreholes. Based on the subsurface conditions encountered at the HA20-CMT-3 location, an additional well screened in the glacial till strata was proposed. This location had a thicker sequence of glacial till and the additional well could provide additional data on potential depths of the proposed containment wall. This additional well was installed and designated HA20-CMT-3T(OW).

Wells were constructed with 2 in. machine-slotted polyvinyl chloride (PVC) screen and 2 in. PVC riser pipe. The location of the well screen, screen slot size, and filter pack was determined based on field conditions. Table HB1-1 includes a summary of the well screen intervals, the formations screened, and the elevations of the screened interval. The observation well logs are included in Exhibit HB1-3.

Following the installation, observation wells were developed in accordance with NMI-GW-002 Monitoring Well Development Operating procedure included in the Field Sampling Plan (FSP).

2.4.1 Groundwater Elevation Monitoring

Groundwater levels were measured in all the CMT channels and observation wells following well development. An additional round of site-wide groundwater levels was also conducted prior to an April 2021 sampling event. Table HB1-2 includes a summary of the groundwater monitoring events and additional rounds of groundwater monitoring conducted around the HB during the PDI work.

2.4.2 Hydrogeologic Testing

A series of field tests were performed within select observation wells to evaluate hydrogeologic properties, which included monitoring the results from field testing such as pulse testing, short duration pumping tests, and slug tests on completed observation wells and CMTs. Test results provided an estimate of the hydraulic conductivity (k) of each hydrogeologic unit within the area of the proposed HB containment wall. Pneumatic slug tests were performed at each CMT well port and rising/falling head slug tests were performed at observation wells installed in this PDI. Additionally, short-duration pumping tests were performed at the 2 in. diameter observation wells.

2.4.2.1 Slug Tests

In-situ slug tests were performed at observation wells HA20-CMT-3T(OW), HA20-CMT-3B(OW), HA20-CMT-5(OW), and HA20-CMT-6(OW) to estimate hydraulic conductivity. This testing included rising and falling head slug tests. The tests were recorded using a pressure transducer (Solinst Levelogger™) placed at the bottom of the observation well, which measured water pressure every two (2) seconds during testing. Static water level was measured prior to testing to convert the water pressure to feet of water over the pressure transducer. Testing consisted of lowering a sand-filled Teflon tube (i.e., slug bar) into the well, which raised the water level by displacing water within the well. The recovery rate of the water to reach static level is a falling head slug test. Once that test was completed, the slug bar was removed, and the resulting displacement of the water was lower than static. The rate of recovery to static water level for this portion of the test is a rising head permeability test. The falling and rising head tests were repeated up to three (3) times on each well.

2.4.2.2 Short Duration Pumping Tests

Following well installation and development, Haley & Aldrich performed a series of groundwater pumping tests on the observation wells installed in this PDI to evaluate aquifer properties. The test method consisted of placing a Geotech Geosub-2 submersible pump and Solinst Levelogger™ Model 3001 (Levelogger) in the corresponding pumping well and two (2) surrounding observation wells. The leveloggers were placed at the bottom of the pumping and observation wells, which are equipped with a pressure transducer that measures water pressure and a self-contained electronic data acquisition system. Haley & Aldrich also installed a Solinst Barologger™ to compensate for changes in barometric pressure during the pumping tests.

The water level response in the pumping well and surrounding were monitored and recorded every two (2) seconds in the pumping well and every five (5) seconds in the observation wells during the pumping test. In addition, water levels in surrounding CMT well ports were manually monitored using a hand-held water level meter throughout the duration of each pumping test.

2.4.3 Groundwater Sampling

Groundwater sampling was completed following the installation of the observation wells and CMT wells as part of the site-wide groundwater monitoring event conducted in April 2021. A total of 18 groundwater samples were collected from the recently installed CMTs and OWs during the April monitoring event. The OWs and CMT channels that were sampled were analyzed for the target chemicals of concern listed in the site ROD in order to characterize groundwater quality within the discrete geologic zones of the proposed HB containment wall area.

Groundwater sampling was performed using low-flow methodology as outlined in the U.S. Environmental Protection Agency (EPA) Low-Stress (Low-Flow) Standard Operating Procedure EQASOP-GW4. A copy of the NMI-GW-010 was included in the FSP.

2.5 TEST PITS FOR EVALUATING UTILITY ALIGNMENT AND STRUCTURAL SUPPORT OF FORMER PUMP HOUSE

The existing pump house, sometimes referred to as the tank house, is located nearby the alignment of the proposed HB containment wall, and accordingly, associated subsurface structures and utilities may need to be removed to enable wall construction or other adjacent remedial actions. The Schematic included as Figure HB1-1 shows the historic drawing of the Pump House. Figure 1 of the Holding Basin PDI Report shows the proposed alignment of the HB wall and the locations of the borings.

To assess the presence of subsurface structures and utilities, this PDI included a review of available information, including drawings, to determine pump house foundation details (including type and approximate depths), and identification of any potential utility alignments associated with the pump house.

In addition to the review of available information, three (3) test pits (HA-TP-101 through HA-TP-103) were excavated to varying depths 21 April 2021. The test pits were excavated adjacent to the former tank house and north of the tank house to evaluate if utilities penetrate the tank house (as shown on Figure HB1-1) and observe foundations at the pump house. Test pit logs are included in Exhibit HB1-1.

3 Deviations from Work Plan

As discussed in Section 2.4.1, an additional well was screened in the glacial till strata based on the subsurface conditions encountered at the HA20-CMT-3 location. The added location, HA29-CMT-3T (OW), had a thicker sequence of glacial till and the separate well provided additional data on potential depths considered for the containment wall.

4 Results

4.1 GEOTECHNICAL PROPERTIES

4.1.1 Overburden

The subsurface soil descriptions are included on the boring logs in Exhibit HB1-1 and supplemented with grain size distribution testing included in Exhibit HB1-4. Up to 15 soil samples were specified in the Work Plan, but only 12 samples were collected for grain size distribution testing due to consistency in observed soil conditions. Overburden conditions were classified within the HB (HA20-B101 through HA20-B104) and conditions encountered at the test borings generally consist of loose to medium dense Fill (poorly graded SAND, 6 to 8 ft thick) overlying loose to medium dense Ice Contact Deposits (poorly graded SAND, silty SAND, and sandy SILT, up to 47 ft thick). The Ice Contact Deposits were penetrated at two (2) boring locations where medium dense to dense Glacial Till (poorly graded SAND) was encountered in thicknesses of 5 to 10 ft prior to terminating borings. Bedrock was not encountered at the borings inside the HB but is expected to be approximately 80 ft below existing ground surface.

4.1.2 Bedrock

The full core descriptions of the bedrock can be found in boring logs for HA20-CMT-1, HA20-CMT-2, HA20-CMT-3, HA20-CMT-4, HA20-CMT-5, and HA20-CMT-6 included in Exhibit HB1-1, and the photographs and lab testing of the rock core is included in Exhibit HB1-5. The geotechnical data of the rock testing results are provided in Table HB1-3. The Rock Quality Designation (RQD) observed in the rock cores varied between 6% and 100%; generally, the RQD values were between 70% and 95%.

The bedrock has very high compressive strength, ranging from 2,878 to 31,073 pounds per square inch (psi), and the abrasivity is characterized as high (2.00) to extreme (6.00) abrasiveness.

4.2 HYDROGEOLOGIC TESTING AND RESULTS

The data collected from the CMT channels and observation wells around the HB are summarized in Table HB1-4.

Coupled with the chemical testing data, the results from the hydrogeological testing were used to evaluate the potential contaminant pathway and determine the appropriate depth the HB containment wall should penetrate to mitigate the potential migration pathways of contaminants of concern. These results were incorporated into the groundwater modeling completed as part of HB-5 PDI work.

4.2.1 Slug Testing and Results

The recovery data, or rising and falling head data, was interpreted using the Bouwer & Rice and Butler analytical methods. The geometric means of hydraulic conductivity slug test results are summarized below and additional back up information is provided in Exhibit HB1-6.

Well ID	Screen Interval Elevation (ft)	Screen Lithology	Solution	Estimated Hydraulic Conductivity (cm/sec)	Estimated Hydraulic Conductivity (ft/day)
HA20-CMT-3T	110.41 – 90.41	Glacial Till	Bouwer-Rice FH[1]	2.30E-06	0.0065
			Bouwer-Rice RH[2]	3.28E-06	0.0093
			Geomean	**2.75E-06**	**0.0078**
HA20-CMT-3B	83.53 - 73.53	Shallow Bedrock	Bouwer-Rice FH	5.18E-05	0.1469
			Bouwer-Rice RH	1.50E-04	0.4246
			Geomean	**8.81E-05**	**0.2497**

[1] Bouwer-Rice FH: represents results from falling head test procedure.
[2] Bouwer-Rice RH: represents results from rising head test procedure.

Well ID	Screen Interval Elevation (ft)	Screen Lithology	Solution	Estimated Hydraulic Conductivity (cm/sec)	Estimated Hydraulic Conductivity (ft/day)
HA20-CMT-6	98.54 - 93.54	Shallow Bedrock	Bouwer-Rice FH	6.58E-05	0.1866
			Bouwer-Rice RH	7.60E-05	0.2153
			Geomean	**7.07E-05**	**0.2004**
HA20-CMT-5	82.79 - 72.79	Intermediate Bedrock	Bouwer-Rice FH	5.53E-05	0.1566
			Bouwer-Rice RH	4.43E-05	0.1256
			Geomean	**4.95E-05**	**0.1403**

4.2.2 Short Duration Pumping Testing and Results

The pumping test consisted of pumping water from the pumping well at a rate that ranged from approximately 0.3 to 3.0 gpm. The geometric means of the pumping test results are summarized below and additional back up information is provided in Exhibit HB1-7.

Well ID	Screen Interval Elevation (ft)	Screen Lithology	Solution	Estimated Transmissivity (ft2/day)	Estimated Hydraulic Conductivity (cm/sec)
HA20-CMT-3B	83.53 - 73.53	Shallow Bedrock	Hantush-Jacob E[3]	0.798	2.17E-05
			Hantush-Jacob R[4]	0.868	2.36E-05
			Geomean	**0.833**	**2.26E-05**
HA20-CMT-6	98.54 - 93.54	Shallow Bedrock	Hantush-Jacob E	0.275	6.94E-06
			Hantush-Jacob R	0.091	2.29E-06
			Geomean	**0.158**	**3.99E-06**
HA20-CMT-5	82.79 - 72.79	Intermediate Bedrock	Hantush-Jacob E	0.991	4.37E-05
			Hantush-Jacob R	0.215	9.47E-06
			Geomean	**0.461**	**2.03E-05**

4.3 TEST PIT SUMMARY

Test pits conducted to investigate the pump house area indicate portions of the slab and foundation wall are present nearby the planned HB containment wall alignment. While the wall alignment does not run though the pump house, the pump house may need to be removed to enable wall construction or other adjacent remedial actions. The limits of the below grade structures as they are understood from historic drawings were confirmed for the containment wall design as part of this PDI.

[3] Hantush-Jacob E: results represent curve match for entire test duration.
[4] Hantush-Jacob R: results represent curve match for late time data, or recovery portion of pumping test.

4.4 GROUNDWATER QUALITY

Compilation of groundwater quality and the subsurface conditions are shown by the Geosyntec profile, Figure HB1-2, compiled from the PDI work completed by Geosyntec for the groundwater plume. Groundwater quality plotted on the Geosyntec profile is from the April 2021 round of groundwater sampling and analysis.

5 Summary of Future Design Considerations

5.1 CONSIDERATIONS FOR CONTAINMENT WALL DESIGN

The primary objective of the containment wall is to mitigate the migration of DU from the source area of the site, which is the holding basin. The primary pathway of DU is through the overburden deposit. The ice contact deposit overlying the glacial till and bedrock contains the significant mass of DU. In order to contain the DU within the sand and gravel ice contact deposit, the containment wall needs to penetrate at least 5 ft into the underlying glacial till. However, as shown on Figures 2 through 6 of *HB Summary Report*, the glacial till thickness is variable along the alignment of the containment wall. As a result, the alternative wall embedments are being evaluated based on the subsurface conditions include:

- 5 ft embedment into glacial till
- 10 ft embedment into glacial till or to top of bedrock
- 5 ft embedment into bedrock

The containment wall alignment and these alternative embedments are shown in plan and profile on Figure 7 of *HB Summary Report*. As a part of the 30% RD, cost, seepage modeling data, and mix design specifications will be considered in order to determine an appropriate well embedment.

Information on the physical properties of the bedrock obtained during this PDI will be used to further evaluate constructability factors for excavating the overburden using a clam shell and hydromilling of the bedrock as necessary to achieve appropriate cutoff depth of the installed containment wall. These characteristics of the rock will be important in the developing the 30% RD of the containment wall.

5.2 GROUNDWATER EVALUATION

A series of hydrogeologic tests were performed on the newly installed wells to characterize groundwater flow within the proposed containment wall alignment. It is not expected that the final alignment of the wall will incorporate all saturated soils where DU is present. Otherwise, it would need to extend to encompass essentially the full extent of the groundwater DU plume. DU in soil and groundwater inside and outside the wall alignment will also be treated with In-Situ Stabilization (ISS).

The HB containment wall PDIs, incorporated as subsequent Appendices, include the seismic analysis (HB-2, Appendix B), mix design for the wall material (HB-3, Appendix C), slope stability (HB-4, Appendix D), and the seepage analysis (HB-5, Appendix E). In addition, the ISS of the soils within the HB and the plume core is also part of the overall remedy for containment of the DU. Furthermore, Institutional Controls (ICs) will be in place once the HB remedy is completed to prevent future excavation or development of the footprint of the HB.

5.3 GEOTECHNICAL EVALUATION AND CONSIDERATIONS FOR CAP DESIGN

Fill inside the holding basin and the sand and gravel deposit below groundwater will have injections of apatite and other materials to sequester the uranium within the footprint of the HB. In order to allow for the injections of apatite there will be some interim grading conducted to fill the HB to about elevation (El.) 170 so the injections can extend vertically down along the current steep side slopes of the HB. The final grades of the HB with a low permeability cap will be about flush with the top elevation of the HB, which varies from about El. 185 to El. 175. The underlying Ice Contact Deposits and Glacial Till are not anticipated to settle significantly under new loading from up to approximately 25 ft of fill to be placed during closure of the holding basin. Due to the granular nature of the natural soils, most of the settlement resulting from placement of new fill is anticipated to occur within a few months after final grade has been reached and settlement should not be of magnitude that will damage the cover system or adversely impact grading to provide positive surface drainage from the area. Long-term consolidation settlement of the natural soils is not anticipated. Additional analysis related to capping is included in the HB-4 PDI Summary.

HA20-GP-105	C1	110.4 - 111.8	Very hard, fresh, grey with pockets of dark grey medium to coarse grained ACTON GRANITE, massive	73%	110.51 - 111.20	161	11492	111.21 - 111.31	3.85	4.29	Extreme

Abbreviations and Units:
PDI = Potential Degradation Index
ft = feet
BGS = Below Ground Surface
RQD = Rock Quality Designation
pcf = pounds per cubic foot
psi = pound per square inch
CAI = CERCHAR Abrasiveness Index
CAIs = CERCHAR Abrasiveness Index for smooth (saw cut) surface
CAI* = CERCHAR Abrasiveness Index for natural surface

Notes:

1. The full core descriptions can be found in the boring logs for HA20-CMT-1, HA20-CMT-2, HA20-CMT-4, HA20-CMT-5, HA20-GP-102A and HA20-GP-105. These borings were drilled in October 2020 through January 2021 by Haley & Aldrich as a part of the field exploration program in support of the Remedial Design for the Nuclear Metals, Inc. site.
2. The analytical testing was performed by GeoTesting Express of Acton, Massachusetts.
3. During the uncompressive strength testing, the axial load was applied continuously at a stress rate that produced failure in a test time between 2 and 15 minutes.
4. The CERCHAR test is run on a saw cut surface of the core sample using a stylus with a hardness of 54/56 HRC
5. The correlation between CAIs and CAI* is as shown below:
   CAI* = (0.99 × CAIs) + 0.48
6. CAI Classification is as follows:
   - Very low abrasiveness 0.30–0.50
   - Low abrasiveness 0.50–1.00
   - Medium abrasiveness 1.00–2.00
   - High abrasiveness 2.00–4.00
   - Extreme abrasiveness 4.00–6.00
   - Quartzitic 6.0–7.0 N/A

ABBREVIATIONS AND NOTES:
mg/L: milligrams per liter
NA: Not Applicable
ug/L: micrograms per liter
-: Not Analyzed

- Analytes detected in at least one sample are reported herein. For a complete list of analytes see the laboratory data sheets.
- Bold values indicate a detection above the reporting limit.
- Shaded values indicate an exceedance of the Overburden or Bedrock ROD Cleanup Level.
- Bedrock and Overburden ROD Cleanup Levels are from Table L-1 - Groundwater Cleanup Levels, as listed in the Record of Decision (ROD).

ABBREVIATIONS AND NOTES:
mg/L: milligrams per liter
NA: Not Applicable
ug/L: micrograms per liter
-: Not Analyzed

- Analytes detected in at least one sample are reported herein. For a complete list of analytes see the laboratory data sheets.
- Bold values indicate a detection above the reporting limit.
- Shaded values indicate an exceedance of the Overburden or Bedrock ROD Cleanup Level.
- Bedrock and Overburden ROD Cleanup Levels are from Table L-1 - Groundwater Cleanup Levels, as listed in the Record of Decision (ROD).

LEGEND

- EXISTING GROUND SURFACE (NOTE 1)
- TOP OF TILL
- TOP OF BEDROCK
- URANIUM µg/L ISOCONCENTRATION CONTOUR THROUGH JULY 2021(DASHED WHERE INFERRED)
- DEPLETED URANIUM µg/L ISOCONCENTRATION CONTOUR JULY 2021
- APPROXIMATE POTENTIOMETRIC SURFACE IN BEDROCK GROUNDWATER
- APPROXIMATE WATER TABLE ELEVATION
- INFERRED GROUNDWATER FLOW DIRECTION IN BEDROCK

MONITORING WELL
- SCREENED INTERVAL
- 2.4 ISOTOPICALLY NATURAL URANIUM (µg/L)
- 58.6 DEPLETED URANIUM (µg/L)
- PACKER TEST INTERVAL
- (44.2) PACKER TEST RESULTS OCTOBER 2020

SEE NOTE 6

- 30 µg/L - 2015 ROD RG.
- OVERBURDEN
- GLACIAL TILL
- ANDOVER GRANITE WEATHERED BEDROCK
- SHAWSHEEN GNEISS WEATHERED BEDROCK
- ASSABET QUARTZ DIORITE BEDROCK
- SHAWSHEEN GNEISS BEDROCK
- ANDOVER GRANITE BEDROCK
- FRACTURE INTERPRETED IN BEDROCK CORES OR GEOPHYSICAL LOGS

NOTES:

1. THE CROSS-SECTION ALIGNMENT IS SHOWN IN PLAN VIEW ON FIGURE 2-7.
2. GROUND SURFACE FROM TOPOGRAPHIC MAP TITLED "EXISTING CONDITIONS PLAN 2229 MAIN STREET, CONCORD MASS" PREPARED BY FELDMAN LAND SURVEYORS, DATED 2020-6-19 AND FROM AN AERIAL MAP FLOWN IN NOVEMBER 2001 PREPARED BY SANBORN INC. AND IS APPROXIMATE.
3. ALL DATA COLLECTED IN APRIL 2021 EXCEPT FOR PACKER TEST DATA AT OPEN BEDROCK (BEW) WELLS COLLECTED IN OCTOBER 2020, MW-B1D13, MW-B2D13, MW-B3D13, MW-B1D28, AND MW-B2D28 COLLECTED IN MAY AND JUNE 2021. WELLS HA20-CMT1-D1/D2, CMT2-D2/D3,CMT3-D3/D4/T(OW) SAMPLED IN JULY 2021.
4. J = ESTIMATED VALUE: COMPOUND IS DETECTED, BUT BELOW THE SAMPLE QUANTITATION LIMIT. NS = NOT SAMPLED.
5. DEPTHS TO TOP OF BEDROCK AND WELL SCREENS ARE APPROXIMATE.
6. WELL NAME DESIGNATIONS FROM LEFT TO RIGHT INDICATE THE SHALLOWEST TO THE DEEPEST AT THAT LOCATION. BEDROCK EXTRACTION WELLS (BEW) SHADED GREEN ARE OPEN BEDROCK BOREHOLES, EXCEPT BEW-5 WHICH HAS A 4-INCH DIAMETER, 20-FOOT LONG STAINLESS STEEL SCREEN.
7. RG = REMEDIATION GOAL. ROD = RECORD OF DECISION, SEPTEMBER 2015. BEW - BEDROCK EXTRACTION WELL
8. ORANGE ISOCONCENTRATION CONTOURS LINES DEPICT VERTICAL DISTRIBUTION OF ISOTOPICALLY NATURAL URANIUM IN GROUNDWATER. FOR OPEN BEDROCK BOREHOLES, THE APRIL 2021 OPEN BOREHOLE MONITORING DATA WAS USED FOR CONTOURING (NOT OCTOBER 2020 PACKER TEST RESULTS).
9. ANALYTICAL CONCENTRATION CONTOURS DO NOT HONOR ALL OF THE DATA PRESENTED, BUT ILLUSTRATE A CONSERVATIVE INTERPRETATION (I.E. USING THE HIGHER VALUE WHEN NECESSARY). SOME DATA WERE POSTED, BUT NOT USED IN CONTOURING BECAUSE THE WELL LOCATION IS VERY FAR FROM THE CROSS-SECTION LINE.

Depth, feet	Water Level	Stratigraphy	Lithologic Description	Core/Run Interval (ft)	Recovery (in.)	Sample Blows (per ft)	Overburden Unified Soil Classification	Comments
140			Recovered Assabet Quartz Diorite at 140.0 ft to 152.0 ft -ASSABET QUARTZ DIORITE-					
145								
150								
			BOTTOM OF EXPLORATION AT 152.0 FT Note: Set 3.0 in. seismic casing at 152.0 ft but upon retrieval, 45.0 ft of 6.0 in. drill casing disconnected. During recovery of lost drill casing, 3.0 in. seismic casing was broken above bedrock socket. Abandoned 3.0 in. seismic casing and grouted boring to surface. Seismic array will now drill east from HA20-101.

RE: Standard Penetration Test Energy Measurement Calibration
Boart Longyear RC100 w/ Automatic Hammer
Concord, Ma

Dear Fred:

At your request, we have analyzed the standard penetration test energy measurement calibrations taken on October 8, 2020. The testing was conducted in order to evaluate the energy delivered to the sampling rods for various drill rig and hammer combinations. This information was used to determine the appropriate energy correction factor for the rig-hammer system. The particular rig tested in this report was the Boart Longyear RC 100 with an Automatic Hammer. The dynamic testing was carried out in general accordance with ASTM D4633-10, “Standard Test Method for Energy Measurement for Dynamic Penetrometers”.

Field Information

One Boart Longyear RC 100 with an Automatic Hammer was evaluated. See Appendix B for pictures of the rig. The rig was fitted with an automatic hammer. A borehole was performed at onsite at 2229 Main Street in Concord, Ma. The drilling was accomplished using 4” ID HW Casing and AWJ rods. A standard split spoon sampler was used to collect the samples. Standard penetration tests (SPTs) were conducted at depths of 30, 32, 34, 37 and 39 feet in general accordance with ASTM D1586. The collected soil samples generally indicated silty sand and sandy silt. Refer to Table 1 for details on the field information and conditions.

Instrumentation

For tests the instrumentation consisted of an 18 inch long AWJ rod sub section. The rod was equipped with two full bridge foil resistance strain gages. Two piezo resistive accelerometer transducers were also attached to each of the instrumented sub sections. A Pile Driving Analyzer™ (PDA) Model 8G, manufactured by Pile Dynamics, Inc. was used to collect the data. The PDA is a computer fitted with a data acquisition and signal conditioning system. During driving of the drill string, the strain and acceleration signals are recorded and processed for each hammer blow. The strain signal is converted to a force record and the acceleration signal is converted to a velocity record. The PDA saves selected hammer blows containing this information to disk and determines the compressive stresses, displacement, and energy at the point of measurement. This information can be viewed on the computer screen during driving. Refer to Appendix A for literature and background on dynamic testing in general.

Energy Measurement

The primary purpose of the testing was to determine the energy transferred from the hammer to the instrumented subsection. The PDA measurements of force and velocity were analyzed to calculate the energy using the FV method (EMX), which is based on both force and velocity measurements as follows:

$$EMX = \int F(t)\, v(t)dt$$

Another method, known as the EF2 method, was not used due to the limitations associated with the measurements (i.e. based on force alone assuming proportionality at the gage locations since velocity is not used in the analysis). The EF2 method is not the recommended method in ASTM D4633.

The rated energy (designated as ER) for the hammer is 0.35 kip-ft based on the 2.5 feet (30 inch) drop height and 0.14 kip (140 pound) ram. The actual efficiency or energy transfer ratio (ETR) for the hammer system can then be determined using EMX and ER as follows:

ETR = (EMX/ER)*100%

For SPT, the typical ETR is taken as 60%, based on history and experience from prior studies. To adjust the measured SPT N values (Nmeasured) for actual hammer performance, the ETR can be used to correct the Nmeasured to N_{60} by using the correction factor (Cn) determined as:

Cn = ETR/60%

and N_{60} = Cn * Nmeasured.

This is a correction for energy only. The application of additional corrections for overburden, non-conventional samplers, etc., was not considered in this study and should be evaluated for appropriateness by the geotechnical engineer for this project.

Results

The results of the testing program are summarized in Tables 1 for the automatic hammer. The tables include EMX, ER, ETR, FMX (maximum measured force in the rod subsection), and BPM (blows per minute). The blow count, including the SPT N- value, and the soil description were recorded by others. See Appendix C for the boring log. The data was presented with statistical information including the average, maximum, minimum and standard deviation for the N-value associated with group of data sets (sample depths) for the hammer. In addition, the data for all depths for a particular hammer combined are also presented in the tables. Note that the N-value may not match the number of blows analyzed due to differences between the inspector's blow count observations and the PDA recorded number. In some cases, bad blows or unreliable data from the PDA may also have been omitted. These results for the blows are presented in Appendix D as plots with blow number and in tabular form. Additional information is also presented in Appendix D including maximum velocity, maximum acceleration, maximum displacement and final displacement.

For the Boart Longyear RC 100 with an Automatic Hammer, the results indicate that the average ETR varied between 83% and 93% for the five conforming test depths. The average ETR for all data with N-Values between 10 and 50 (5 locations) was around 87%, resulting in an overall Cn = 1.45. The typical blow rate was around 57 bpm for the automatic hammer.

This report has been prepared in accordance with generally accepted geotechnical engineering principles with specific application to this project. Our conclusions are based on applicable standards of practice, including any information reported to and/or prepared for us. No other warranty, expressed or implied, is made.

We have appreciated this opportunity to work with you on this project. If you have any questions regarding this report, please contact us at (978) 251-9395.

Sincerely,
Geosciences Testing and Research, Inc.

Domenic E. Valeri
Geotechnical Engineer

Notes:
1. NWJ rods used with NWJ instrumented rod.
2. The soil description and SPT N-value were recorded by others. The SPT N-value is the sum of the middle 2 numbers when the sampler s driven for 4 - six inch intervals
3. Blows analyzed correspond to SPT N-value and may not match up exactly with the N-value due to differences in blow count logging between PDA and inspector or poor data quality.
4. EMX is the integration of F and V obtained from the PDA.
5. ER is the rated energy of 0.35 kip-ft based on 140 pound hammer and 2.5 feet drop height.
6. ETR is the energy transfer ratio based on (EMX/ER)*100%.
7. Cn is the energy correction factor which is equal to ETR/60% and is used to convert the measured SPT N-value to the corrected equivalent value representing 60% energy transfer.

APPENDIX A
DYNAMIC ANALYSIS LITERATURE

HIGH STRAIN DYNAMIC PILE TESTING

Introduction

Dynamic pile testing (a.k.a. High Strain Dynamic Pile Testing - HSDPT) is commonly employed for evaluating the capacity of driven piles. It is also provides information about hammer performance and pile integrity/stresses. Dynamic testing is carried out in accordance with ASTM D4945, “Standard Test Method for High Strain Dynamic Testing of Piles”. Dynamic pile testing involves using strain gages and accelerometers to record an impact wave and its reflections generated by a piling hammer. Both driven piles and drilled foundations can be tested (provided that an impact hammer is used to create the high strain wave for the drilled foundations).

Procedure

Dynamic pile testing was performed using a Pile Driving Analyzer (PDA®), such as the PAK®, PAL®, or PAX® systems, manufactured by Pile Dynamics, Inc. (PDI) of Cleveland, Ohio. These systems are computers fitted with data acquisition and signal conditioning components. The instrumentation consists of two strain gages and two accelerometer transducers attached a minimum of 1.5 pile diameters below the pile top. During impact, the strain and acceleration signals are recorded and processed for each hammer blow. The strain signal is converted to a force record and the acceleration signal is converted to a velocity record. The PDA® saves selected hammer blows containing this information to disk and determines the transferred energy, compressive/tensile stresses, displacement, pile integrity, and the estimated pile bearing capacity using the Case Method. This information can be viewed on the computer screen during driving. A screen shot of data collection in the PDA® Windows (PDA-W®) Program is provided in Figure 1. Selected blows can be further processed to predict the static pile capacity using signal matching programs.

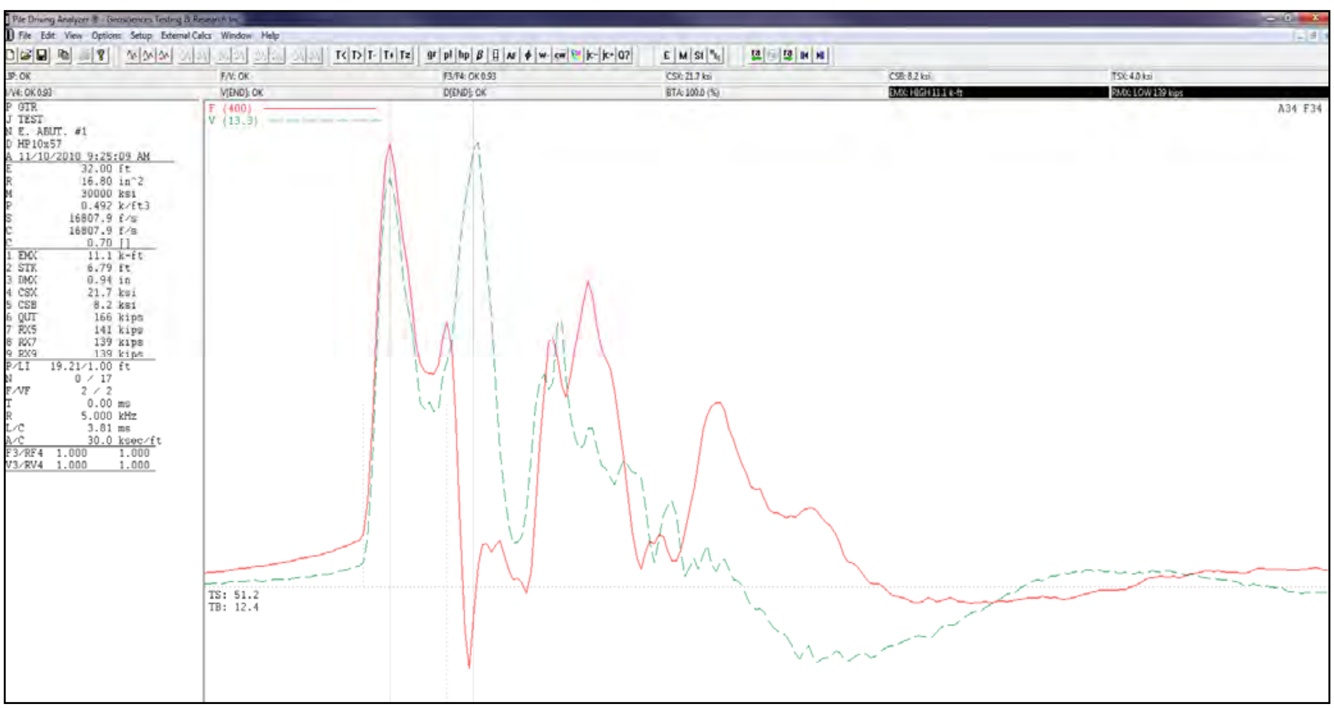

Figure 1. Data collection during pile driving in the (PDI - PDA®-Win Program).

Theory

When a ram strikes the pile head, it initiates a large strain wave that propagates down the pile as illustrated in Figure 2. External soil resistance or changes in the pile's impedance (due to variations in the pile's material or geometry) causes reflection waves that are recorded by the instrumentation. Knowing the material properties and pile geometry at the point of measurement, the strain can be converted to force, while the acceleration is integrated with time to produce velocity.

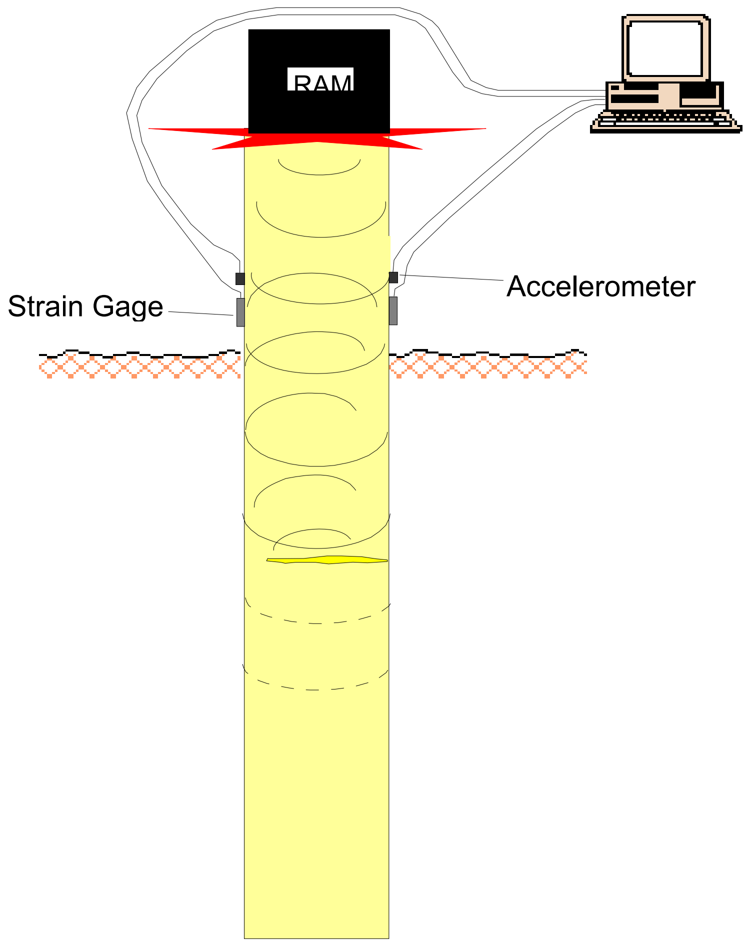

Figure 2. Pile instrumentation and hammer impact.

As long as there is no change in the pile impedance and there are no external forces (i.e. friction), the force and velocity are proportional (equal). Reflections at the tip can be explained by two classical boundary conditions. Free end conditions (analogous to easy driving through soft clay) require zero force and no velocity restrictions at the tip, resulting in a compression wave returning as a tension wave and an increase in velocity (theoretically doubling). Figure 3 graphically presents a typical reflection from a pipe pile during penetration into soft clay. Fixed end conditions (analogous to hard driving into bedrock) require zero velocity and no force restrictions at the tip, resulting in a compression wave being reflected with a greater magnitude than the incident wave (theoretically doubling) and the tip velocity at theoretically zero. Figure 4 graphically presents a typical reflection from an H-pile driven to bedrock. The time the wave takes to travel down to the tip and reflect back to the transducers is twice the pile length divided by the wave speed of the pile material (2L/C).

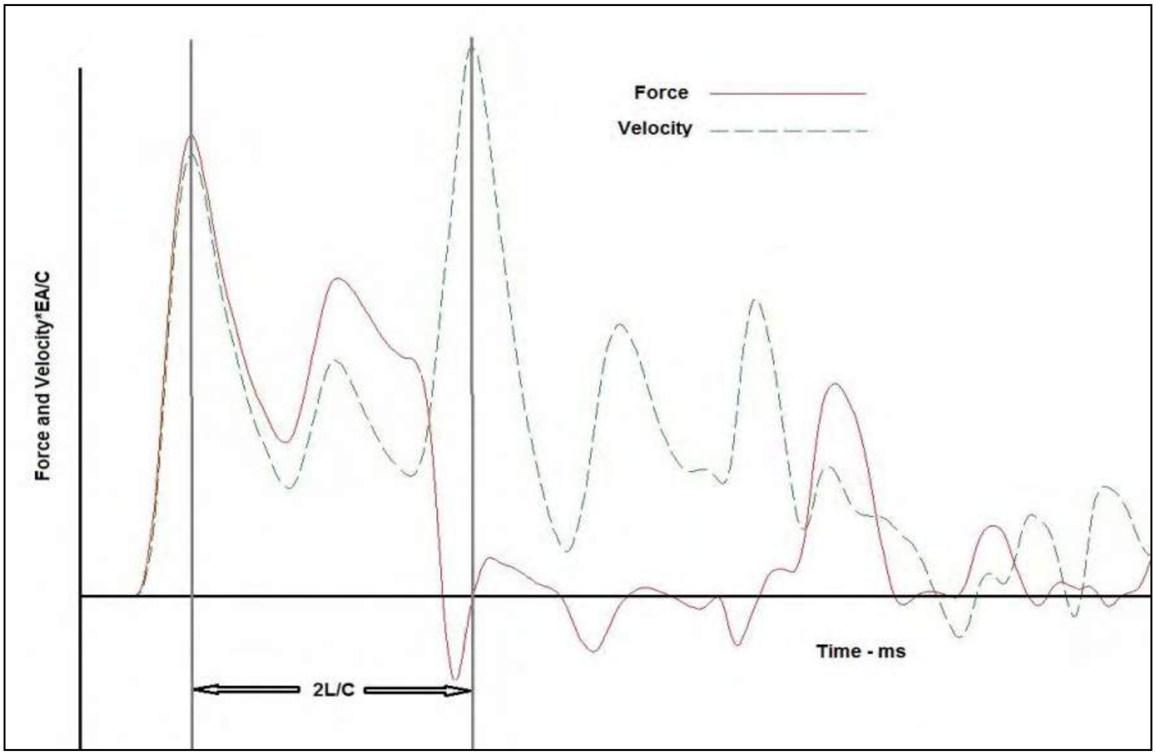

Figure 3. Typical Force and Velocity traces for a pipe pile driven into soft clay
(high velocity and low force at tip - 2L/C).

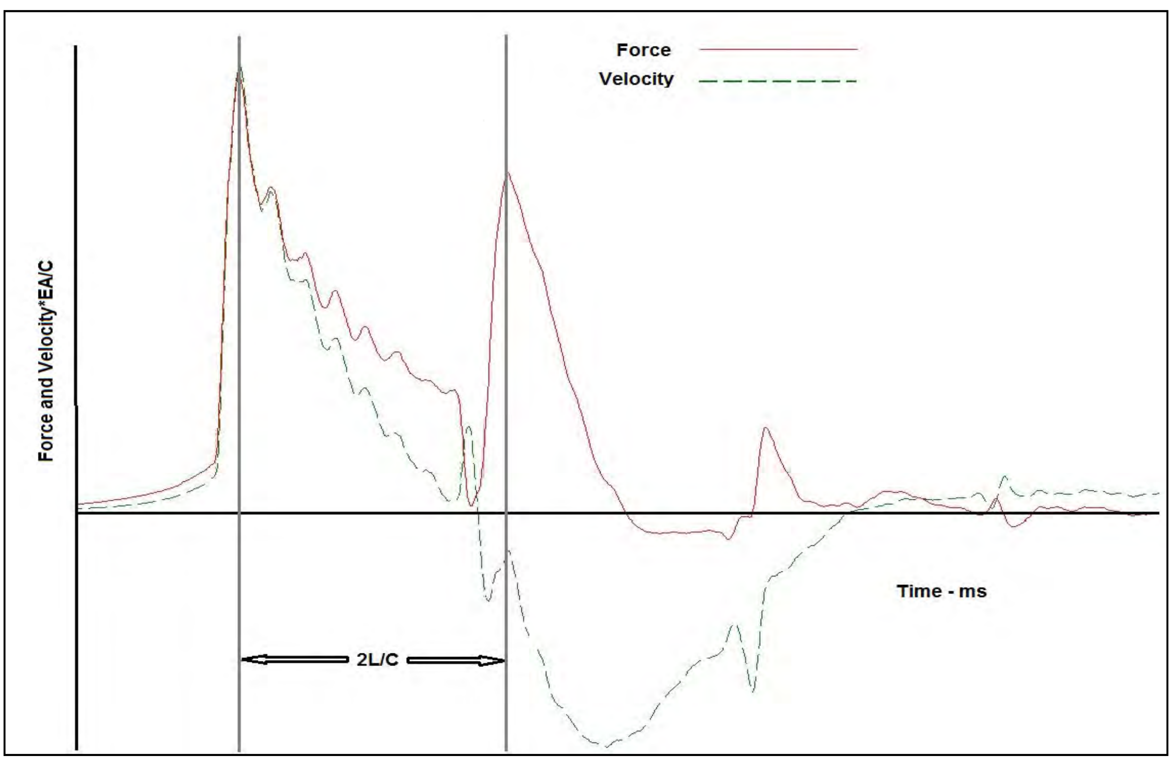

Figure 4. Typical Force and Velocity traces for an H-pile driven into bedrock
(high force and low velocity at tip - 2L/C).

If a pile contains a defect or is damaged (e.g. reduction in impedance) during driving, the wave reflecting from the zone of decreased impedance will show a reduction in the force and increase in the velocity (somewhat comparable to "free end conditions"). These reflections would arrive to the measuring transducers before the expected reflections associated with the pile tip as the damaged zone is at a point along the pile between the transducer location and pile tip. The detection of damage during driving is usually easily identifiable and typically associated with cracking of concrete piles or splice breakage.

Dynamic Testing Summary Output

After data collection, the most pertinent output quantities from the dynamic pile testing can be summarized in a graphical manner. The data can be also presented in tabular format, averaging the results based on penetration depth or blow number as specified by the user. Figure 5 shows typical graphical output. Each of the three plots presents two quantities sharing the vertical (penetration) axis.

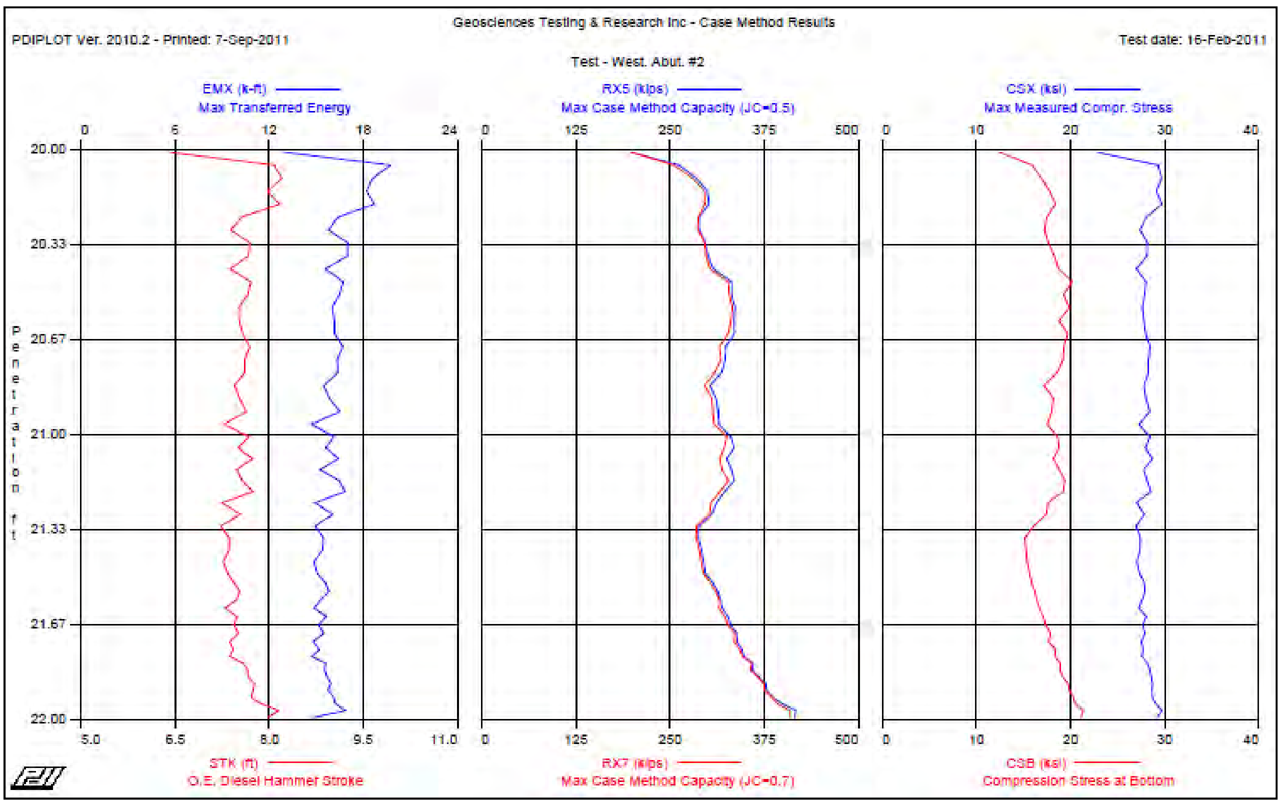

Figure 5. Typical Dynamic Testing summary Output (PDI Plot® Program)

Signal Matching Analyses

Signal matching using the dynamic testing data can be performed to predict the static pile capacity. Programs such as CAPWAP® (developed by Pile Dynamics, Inc.) or TEPWAP/PWAP (developed by GTR) are numerical analyses used to solve the one dimensional wave equation using the measured force and velocity. E.A Smith (1960) suggested modeling the hammer-pile-soil system for use in the wave equation by a series of masses, springs and dashpots as shown in Figure 6. The signal matching programs determine the best match between measured and calculated pile top forces and replace the hammer input with the measured force and velocity. The pile is separated into many small segments, often 1 meter in length. The velocity record obtained from the dynamic pile testing transducers is used as input to the top pile segment. The resistance, damping, and quake are the primary soil parameters assigned by the user to each pile segment below grade. The signal matching programs will calculate the displacement, velocity, and stresses (forces) for each pile segment based on the input velocity record and the user assigned soil parameters. These parameters are adjusted and modified in an iterative fashion until the best match is obtained between the force calculated for the pile top segment and the force measured at the pile top during testing. The user assigned soil parameters based on the best match represent the “actual soil conditions”, including the resistance (and therefore pile capacity). This capacity is based on the resistance at the time of the testing. Static load tests are typically conducted several days or weeks after driving. Therefore, restrike tests are recommended to be performed some time after driving to assess time dependent changes in pile capacity, such as setup or relaxation.

RE: Standard Penetration Test Energy Measurement Calibration
Tera Sonic TSI 150CC (serial #PE6068L274073) w/ Automatic Hammer (serial #22630-5)
Concord, Ma

Dear Fred:

At your request, we have analyzed the standard penetration test energy measurement calibrations taken on October 8, 2020. The testing was conducted in order to evaluate the energy delivered to the sampling rods for various drill rig and hammer combinations. This information was used to determine the appropriate energy correction factor for the rig-hammer system. The particular rig tested in this report was the Tera Sonic TSI 150CC Rig (serial #PE6068L274073) with an Automatic Hammer (serial #22630-5). The dynamic testing was carried out in general accordance with ASTM D4633-10, “Standard Test Method for Energy Measurement for Dynamic Penetrometers”.

Field Information

One Tera Sonic TSI 150CC Rig (serial #PE6068L274073) with an Automatic Hammer (serial #22630-5) was evaluated. See Appendix B for pictures of the rig. The rig was fitted with an automatic hammer. A borehole was performed at onsite at 2229 Main Street in Concord, Ma. The drilling was accomplished using 4” ID HW Casing and AWJ rods. A standard split spoon sampler was used to collect the samples. Standard penetration tests (SPTs) were conducted at depths of 32, 34, 36, 38 and 40 feet in general accordance with ASTM D1586. The collected soil samples generally indicated silt with occasional sand pockets. Refer to Table 1 for details on the field information and conditions.

Instrumentation

For tests the instrumentation consisted of an 18 inch long AWJ rod sub section. The rod was equipped with two full bridge foil resistance strain gages. Two piezo resistive accelerometer transducers were also attached to each of the instrumented sub sections. A Pile Driving Analyzer™ (PDA) Model 8G, manufactured by Pile Dynamics, Inc. was used to collect the data. The PDA is a computer fitted with a data acquisition and signal conditioning system. During driving of the drill string, the strain and acceleration signals are recorded and processed for each hammer blow. The strain signal is converted to a force record and the acceleration signal is converted to a velocity record. The PDA saves selected hammer blows containing this information to disk and determines the compressive stresses, displacement, and energy at the point of measurement. This information can be viewed on the computer screen during driving. Refer to Appendix A for literature and background on dynamic testing in general.

Energy Measurement

The primary purpose of the testing was to determine the energy transferred from the hammer to the instrumented subsection. The PDA measurements of force and velocity were analyzed to calculate the energy using the FV method (EMX), which is based on both force and velocity measurements as follows:

$$EMX = \int F(t)\, v(t) dt$$

Another method, known as the EF2 method, was not used due to the limitations associated with the measurements (i.e. based on force alone assuming proportionality at the gage locations since velocity is not used in the analysis). The EF2 method is not the recommended method in ASTM D4633.

The rated energy (designated as ER) for the hammer is 0.35 kip-ft based on the 2.5 feet (30 inch) drop height and 0.14 kip (140 pound) ram. The actual efficiency or energy transfer ratio (ETR) for the hammer system can then be determined using EMX and ER as follows:

ETR = (EMX/ER)*100%

For SPT, the typical ETR is taken as 60%, based on history and experience from prior studies. To adjust the measured SPT N values (Nmeasured) for actual hammer performance, the ETR can be used to correct the Nmeasured to N_{60} by using the correction factor (Cn) determined as:

Cn = ETR/60%

and N_{60} = Cn * Nmeasured.

This is a correction for energy only. The application of additional corrections for overburden, non-conventional samplers, etc., was not considered in this study and should be evaluated for appropriateness by the geotechnical engineer for this project.

Results

The results of the testing program are summarized in Tables 1 for the automatic hammer. The tables include EMX, ER, ETR, FMX (maximum measured force in the rod subsection), and BPM (blows per minute). The blow count, including the SPT N- value, and the soil description were recorded by others. See Appendix C for the boring log. The data was presented with statistical information including the average, maximum, minimum and standard deviation for the N-value associated with group of data sets (sample depths) for the hammer. In addition, the data for all depths for a particular hammer combined are also presented in the tables. Note that the N-value may not match the number of blows analyzed due to differences between the inspector’s blow count observations and the PDA recorded number. In some cases, bad blows or unreliable data from the PDA may also have been omitted. These results for the blows are presented in Appendix D as plots with blow number and in tabular form. Additional information is also presented in Appendix D including maximum velocity, maximum acceleration, maximum displacement and final displacement.

For the Tera Sonic TSI 150CC Rig (serial #PE6068L274073) with an Automatic Hammer (serial #22630-5), the results indicate that the average ETR varied between 86% and 95% for the five conforming test depths. The average ETR for all data with N-Values between 10 and 50 (5 locations) was around 91%, resulting in an overall Cn = 1.52. The typical blow rate was around 54 bpm for the automatic hammer.

This report has been prepared in accordance with generally accepted geotechnical engineering principles with specific application to this project. Our conclusions are based on applicable standards of practice, including any information reported to and/or prepared for us. No other warranty, expressed or implied, is made.

We have appreciated this opportunity to work with you on this project. If you have any questions regarding this report, please contact us at (978) 251-9395.

Sincerely,
Geosciences Testing and Research, Inc.

Notes:
1. NWJ rods used with NWJ instrumented rod.
2. The soil description and SPT N-value were recorded by others. The SPT N-value is the sum of the middle 2 numbers when the sampler s driven for 4 - six inch intervals
3. Blows analyzed correspond to SPT N-value and may not match up exactly with the N-value due to differences in blow count logging between PDA and inspector or poor data quality.
4. EMX is the integration of F and V obtained from the PDA.
5. ER is the rated energy of 0.35 kip-ft based on 140 pound hammer and 2.5 feet drop height.
6. ETR is the energy transfer ratio based on (EMX/ER)*100%.
7. Cn is the energy correction factor which is equal to ETR/60% and is used to convert the measured SPT N-value to the corrected equivalent value representing 60% energy transfer.

APPENDIX A
DYNAMIC ANALYSIS LITERATURE

HIGH STRAIN DYNAMIC PILE TESTING

Introduction

Dynamic pile testing (a.k.a. High Strain Dynamic Pile Testing - HSDPT) is commonly employed for evaluating the capacity of driven piles. It is also provides information about hammer performance and pile integrity/stresses. Dynamic testing is carried out in accordance with ASTM D4945, “Standard Test Method for High Strain Dynamic Testing of Piles”. Dynamic pile testing involves using strain gages and accelerometers to record an impact wave and its reflections generated by a piling hammer. Both driven piles and drilled foundations can be tested (provided that an impact hammer is used to create the high strain wave for the drilled foundations).

Procedure

Dynamic pile testing was performed using a Pile Driving Analyzer (PDA®), such as the PAK®, PAL®, or PAX® systems, manufactured by Pile Dynamics, Inc. (PDI) of Cleveland, Ohio. These systems are computers fitted with data acquisition and signal conditioning components. The instrumentation consists of two strain gages and two accelerometer transducers attached a minimum of 1.5 pile diameters below the pile top. During impact, the strain and acceleration signals are recorded and processed for each hammer blow. The strain signal is converted to a force record and the acceleration signal is converted to a velocity record. The PDA® saves selected hammer blows containing this information to disk and determines the transferred energy, compressive/tensile stresses, displacement, pile integrity, and the estimated pile bearing capacity using the Case Method. This information can be viewed on the computer screen during driving. A screen shot of data collection in the PDA® Windows (PDA-W®) Program is provided in Figure 1. Selected blows can be further processed to predict the static pile capacity using signal matching programs.

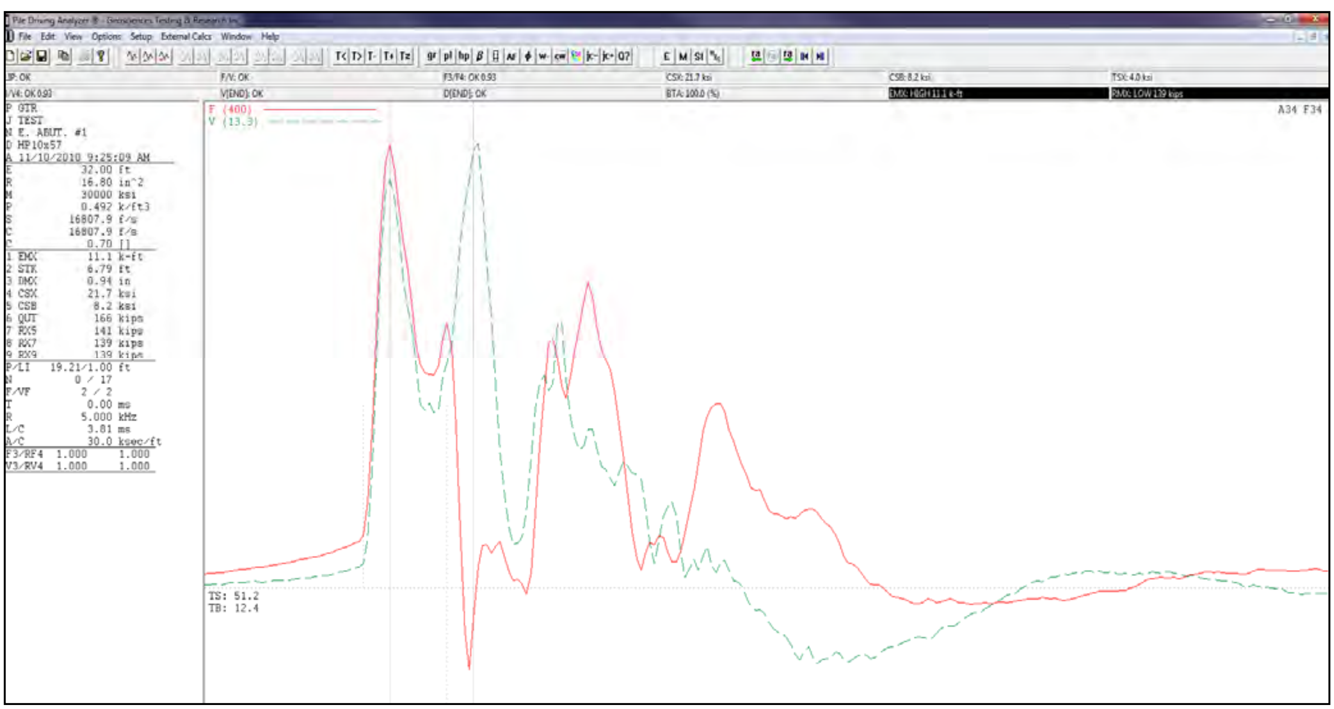

Figure 1. Data collection during pile driving in the (PDI - PDA®-Win Program).

Theory

When a ram strikes the pile head, it initiates a large strain wave that propagates down the pile as illustrated in Figure 2. External soil resistance or changes in the pile's impedance (due to variations in the pile's material or geometry) causes reflection waves that are recorded by the instrumentation. Knowing the material properties and pile geometry at the point of measurement, the strain can be converted to force, while the acceleration is integrated with time to produce velocity.

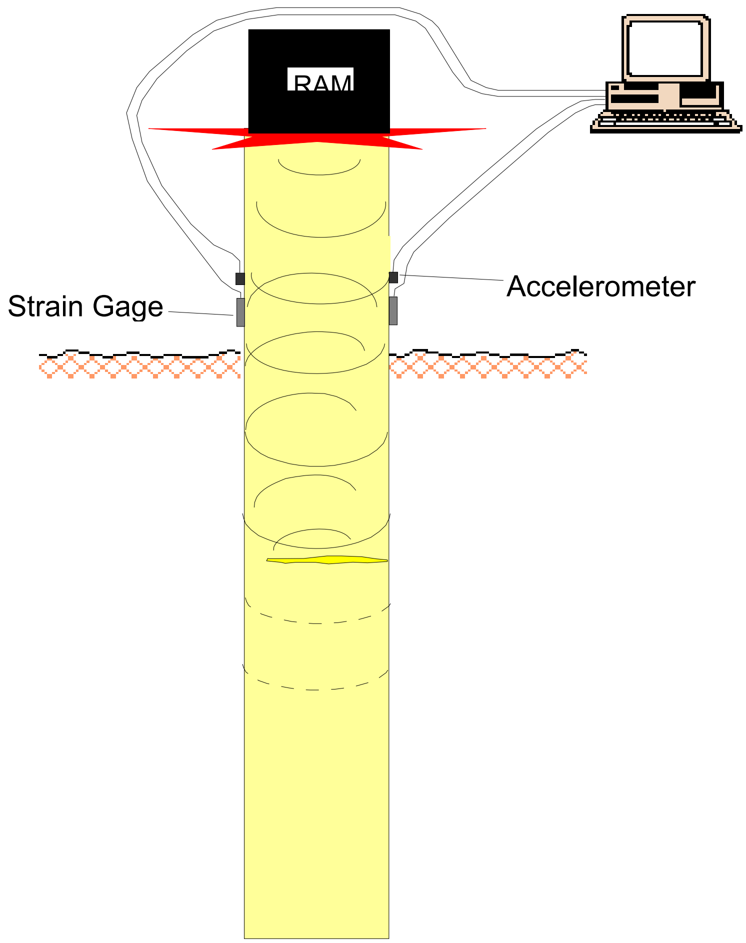

Figure 2. Pile instrumentation and hammer impact.

As long as there is no change in the pile impedance and there are no external forces (i.e. friction), the force and velocity are proportional (equal). Reflections at the tip can be explained by two classical boundary conditions. Free end conditions (analogous to easy driving through soft clay) require zero force and no velocity restrictions at the tip, resulting in a compression wave returning as a tension wave and an increase in velocity (theoretically doubling). Figure 3 graphically presents a typical reflection from a pipe pile during penetration into soft clay. Fixed end conditions (analogous to hard driving into bedrock) require zero velocity and no force restrictions at the tip, resulting in a compression wave being reflected with a greater magnitude than the incident wave (theoretically doubling) and the tip velocity at theoretically zero. Figure 4 graphically presents a typical reflection from an H-pile driven to bedrock. The time the wave takes to travel down to the tip and reflect back to the transducers is twice the pile length divided by the wave speed of the pile material (2L/C).

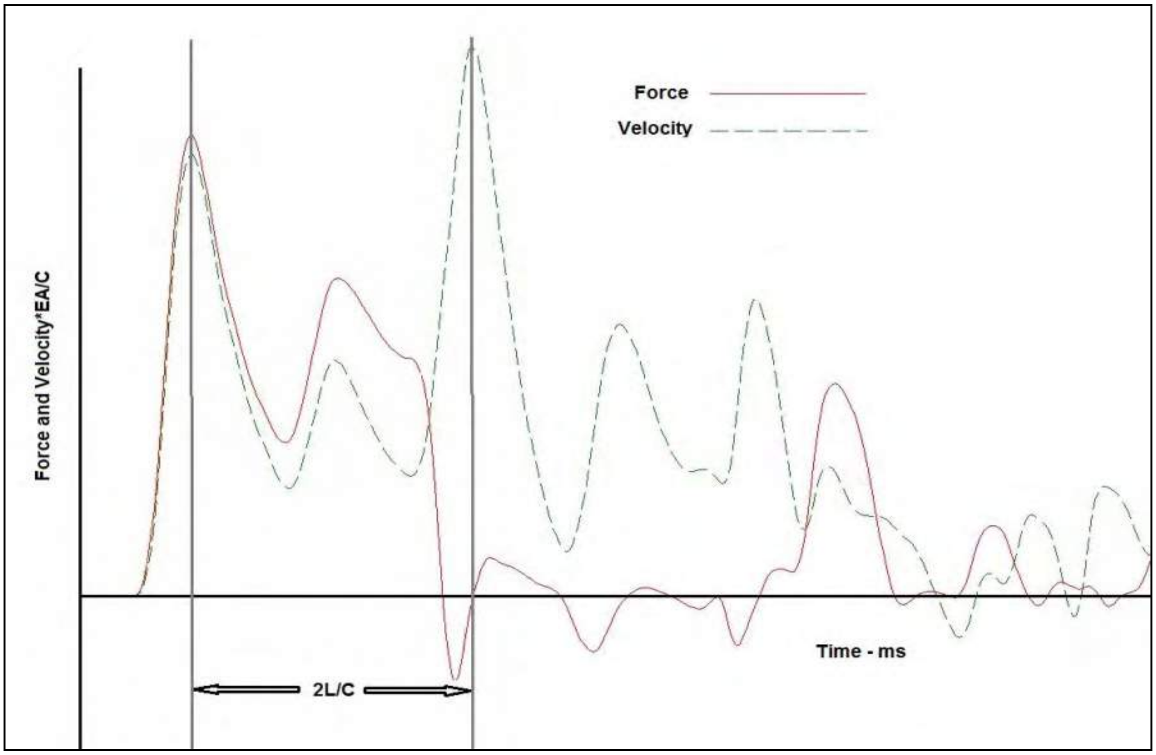

Figure 3. Typical Force and Velocity traces for a pipe pile driven into soft clay (high velocity and low force at tip - 2L/C).

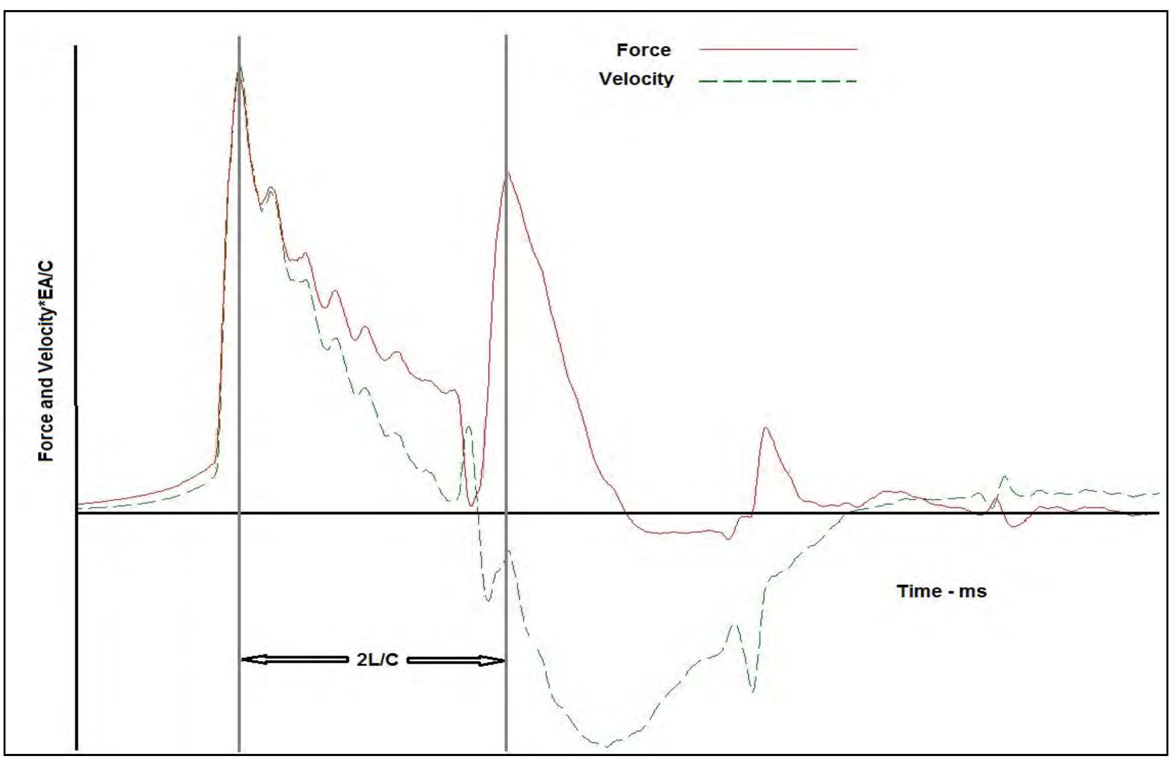

Figure 4. Typical Force and Velocity traces for an H-pile driven into bedrock (high force and low velocity at tip - 2L/C).

If a pile contains a defect or is damaged (e.g. reduction in impedance) during driving, the wave reflecting from the zone of decreased impedance will show a reduction in the force and increase in the velocity (somewhat comparable to "free end conditions"). These reflections would arrive to the measuring transducers before the expected reflections associated with the pile tip as the damaged zone is at a point along the pile between the transducer location and pile tip. The detection of damage during driving is usually easily identifiable and typically associated with cracking of concrete piles or splice breakage.

Dynamic Testing Summary Output

After data collection, the most pertinent output quantities from the dynamic pile testing can be summarized in a graphical manner. The data can be also presented in tabular format, averaging the results based on penetration depth or blow number as specified by the user. Figure 5 shows typical graphical output. Each of the three plots presents two quantities sharing the vertical (penetration) axis.

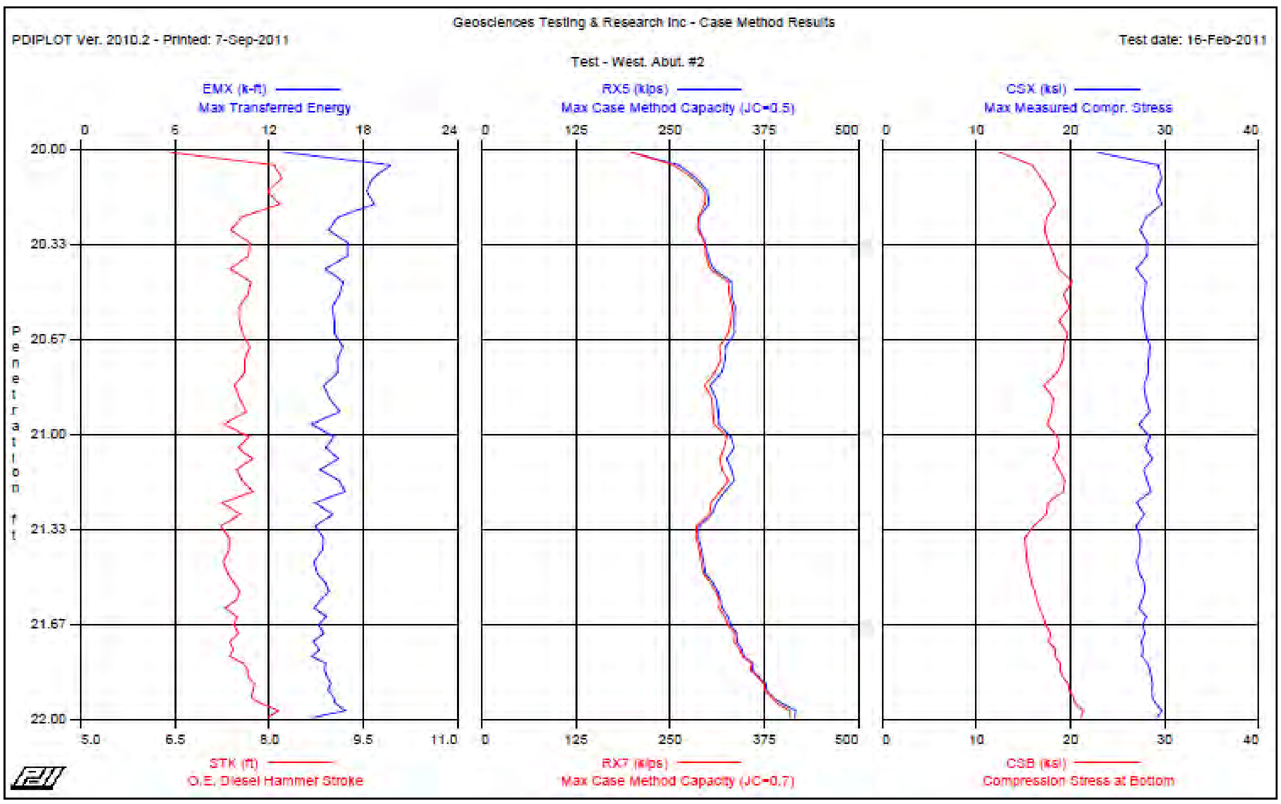

Figure 5. Typical Dynamic Testing summary Output (PDI Plot® Program)

Signal Matching Analyses

Signal matching using the dynamic testing data can be performed to predict the static pile capacity. Programs such as CAPWAP® (developed by Pile Dynamics, Inc.) or TEPWAP/PWAP (developed by GTR) are numerical analyses used to solve the one dimensional wave equation using the measured force and velocity. E.A Smith (1960) suggested modeling the hammer-pile-soil system for use in the wave equation by a series of masses, springs and dashpots as shown in Figure 6. The signal matching programs determine the best match between measured and calculated pile top forces and replace the hammer input with the measured force and velocity. The pile is separated into many small segments, often 1 meter in length. The velocity record obtained from the dynamic pile testing transducers is used as input to the top pile segment. The resistance, damping, and quake are the primary soil parameters assigned by the user to each pile segment below grade. The signal matching programs will calculate the displacement, velocity, and stresses (forces) for each pile segment based on the input velocity record and the user assigned soil parameters. These parameters are adjusted and modified in an iterative fashion until the best match is obtained between the force calculated for the pile top segment and the force measured at the pile top during testing. The user assigned soil parameters based on the best match represent the "actual soil conditions", including the resistance (and therefore pile capacity). This capacity is based on the resistance at the time of the testing. Static load tests are typically conducted several days or weeks after driving. Therefore, restrike tests are recommended to be performed some time after driving to assess time dependent changes in pile capacity, such as setup or relaxation.

inflow while pumping entered between 122 to 130 feet deep (probably at the caliper enlargement & FRes decrease near 123.5 feet, & possibly also at FTemp/FRes variations near 126 &/or 129 feet)

weak upward flow originated greater than 130 feet deep, during both ambient & pumping conditions (possibly near the FTemp & FRes inflections near 130, 132.5 &/or 134 feet); the FRes increase near 135 feet likely represents some drilling residue at the bottom of the borehole

WELL CONSTRUCTION DETAILS

Type of protective cover	Guard Pipe
Height of Guard Pipe above ground surface	3.0 ft
Height of top of riser above ground surface	2.8 ft
Type of protective casing	Guard Pipe
Length	5.0 ft
Inside diameter	4.0 in.
Depth of bottom of Guard Pipe	2.0 ft
Type of riser pipe	Sch. 40 PVC
Inside diameter of riser pipe	2.0 in.
Depth of bottom of riser pipe	98.0 ft

Type of Seals	Top of Seal (ft)	Thickness (ft)
Concrete	0.0	1.0
Grout	1.0	85.0
Bentonite	86.0	10.0
	-	-

Diameter of borehole	6.0 in.
Depth to top of well screen	98.0 ft
Type of screen	Machine slotted Sch 40 PVC
Screen gauge or size of openings	0.010/10 slot
Diameter of screen	2.0 in.
Type of Backfill around Screen	#0 Sand
Depth to bottom of well screen	108.0 ft
Bottom of silt trap	109.0 ft
Depth of bottom of borehole	109.0 ft

HA20-CMT-4-C2	---	98.61-99.26 ft	172	20892	1	No	1,*

Notes: Density determined on core samples by measuring dimensions and weight and then calculating.

All specimens tested at the approximate as-received moisture content and at standard laboratory temperature.

The axial load was applied continuously at a stress rate that produced failure in a test time between 2 and 15 minutes.

Failure Type: 1 = Intact Material Failure; 2 = Discontinuity Failure; 3 = Intact Material and Discontinuity Failure (See attached photographs)

1: Best effort end preparation. See Tolerance report for details.
2: The as-received core did not meet the ASTM side straightness tolerance due to irregularities in the sample as cored.
3: Specimen L/D < 2.
4: The as-received core did not meet the ASTM minimum diameter tolerance of 1.875 inches.
5: Specimen diameter is less than 10 times maximum particle size.
6: Specimen diameter is less than 6 times maximum particle size.

*Because the indicated tested specimens did not meet the ASTM D4543 standard tolerances, the results reported here may differ from those for a test specimen within tolerances.

Summary of Slug Testing Results and Analysis

HALEY ALDRICH	CALCULATIONS	File No.:	131884-004
		Sheet:	1 of 3
Client:	Nuclear Metals Inc.	Date:	3-Nov-21
Project:	Nuclear Metals Inc. Superfund Site	Computed by:	NAF
Subject:	Remedial Design Holding Basin Containment	Checked by:	SHL

PROBLEM STATEMENT & OBJECTIVE

To evaluate the following related to the hydraulic properties of the Holding Basin (HB) at the Subject property:

a) Characterize the groundwater flow within the overburden soils and bedrock within the limits of the proposed low-permeability vertical wall and the cap area within the footprint of the HB.

b) Results will provide an estimate of the hydraulic conductivity (K) of each hydrogeologic unit.

BOUWER AND RICE 1976 EQUATION

$$\ln(H_0) - \ln(H) = \frac{2K_r L t}{r_{ce}^2 \ln(R_e/r_{we})} \quad (1)$$

$$r_{ce} = \sqrt{(1-n_e)r_c^2 + n_e r_w^2} \quad (2)$$

$$r_{we} = r_w \sqrt{K_z/K_r} \quad (3)$$

where

- H is displacement at time t [L]
- H_0 is initial displacement at $t = 0$ [L]
- K_r is radial (horizontal) hydraulic conductivity [L/T]
- K_z is vertical hydraulic conductivity [L/T]
- L is screen length [L]
- n_e is effective porosity (specific yield) of the filter pack [dimensionless]
- r_c is nominal casing radius [L]
- r_w is well radius [L]
- R_e is external or effective radius of the test [L]
- t is elapsed time since initiation of the test [T]

AVAILABLE INFORMATION

1. Boring logs and well installation reports for observation wells including HA20-CMT-3B, HA20-CMT-3T, HA20-CMT-5, and HA20-CMT-6
2. Pressure transducer water level readings throughout the performed slug tests.

CONCEPTUAL ANALYSIS AND REASONING

1. This analysis used a mathematical solution for determining hydraulic conductivity (K) of an aquifer.
2. Analysis involves matching a straight line to water-level displacement data collected over time.
3. Haley & Aldrich repeated three rising and falling slug tests on each well in order to obtain the geometric means of hydraulic conductivity.

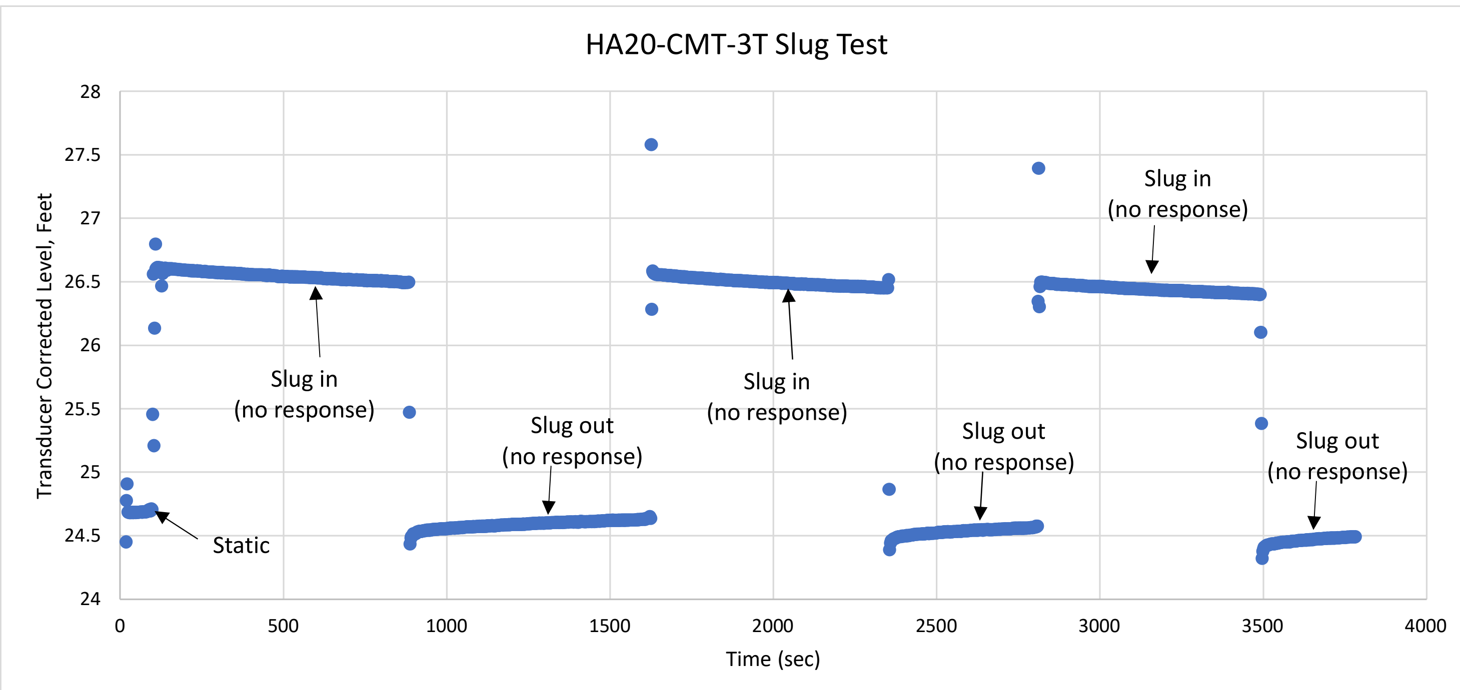
HA20-CMT-3T SLUG TEST RESPONSE CURVE



NOTE: After performing three slug tests (rising/falling head) on HA20-CMT-3T no discernable response was oberserved. However, from the inferred results of slug tests performed on HA20-CMT-3T(OW) a hydraulic conducitivity (K) value is 2.75E-06 cm/sec or 0.0078 ft/day.

EXHIBIT HB1-7

Summary of Pumping Test Data Collection and Analysis

PROBLEM STATEMENT & OBJECTIVE

To evaluate the following related to the hydrogeologic parameters of the bedrock aquifer:

a) Evaluate pumping test response data to determine transmissivity, storativity, and hydraulic conductivity.
b) Three total pumping tests were completed and evaluated in this analysis: HA20-CMT-3B(OW), HA20-CMT-5(OW), and HA20-CMT-6(OW).

3. Aqtesolv Program, HYDROSOLV, Inc.

AVAILABLE INFORMATION

1. Boring logs and rock core reports for observation and pumping wells including: HA20-CMT-3(OW), HA20-CMT-5(OW), and HA20-CMT-6(OW).
2. Pumping test field notes and measurements for rate and depth to water, static groundwater elevations.
3. Transducer water level data from pumping well and each observation well.

HA20-CMT-3B(OW) PUMPING TEST:

1. The HA20-CMT-3B (OW) pumping test occurred on 27 April 2021.
2. The bedrock well was pumping using a Geotech Ss Geosub submerisble pump.
3. The flow rate remained constant at 0.3 gallons per minute for five hours.
4. The resulting geometric mean hydraulic conductivity from the testing is 2.26E-05 cm/sec.

HA20-CMT-5(OW) PUMPING TEST:

1. The HA20-CMT-5 (OW) pumping test occurred on 19 April 2021.
2. The bedrock well was pumping using a Geotech Ss Geosub submerisble pump.
3. The well was pumped at an initial flow rate of 3.0 gallons per minute for 30 minutes. The well was then allowed to recover for approximately one hour to allow water level to return to 75% of initial static conditions. The well was then pumped at a flow rate of 0.3 gallons per minute for five hours.
4. The resulting geometric mean hydraulic conductivity from the testing is 3.99E-06 cm/sec.

HA20-CMT-6(OW) PUMPING TEST:

1. The HA20-CMT-6 (OW) pumping test occurred on 20 April 2021.
2. The bedrock well was pumping using a Geotech Ss Geosub submerisble pump.
3. The well was pumped at an initial flow rate of 2.0 gallons per minute for 30 minutes. The well was then allowed to recover for approximately one hour to allow water level to return to 75% of initial static conditions. The well was then pumped at a flow rate of 0.3 gallons per minute for five hours.
4. The resulting geometric mean hydraulic conductivity from the testing is 2.03E-05 cm/sec.

APPENDIX B

HB-2 - Seismic Analysis

PDI HB-2: Seismic Evaluation for Holding Basin Wall Design

1 Scope of Work

This Pre-Design Investigation (PDI) activity for the holding basin (HB) containment wall involves the seismic evaluation necessary to complete the Holding Basin containment wall design as outlined in the Record of Decision (ROD). Activities performed in accordance with the HB PDI Work Plan (Work Plan) to meet the objectives of this PDI include:

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin	Conduct Seismic Evaluation for Holding Basin Wall Design	• Drill six bedrock boreholes for cross-hole geophysics, forming two sets of 3-hole arrays for the geophysics. • Field shear wave measurements using cross-hole geophysical methods to characterize soil and bedrock to support the probabilistic seismic analysis to meet seismic design applicable or relevant and appropriate requirements (ARARs). • Conduct seismic analysis, determine design loads for containment wall in accordance with ASCE-7 design standards, and perform structural design of wall to resist design earthquake.

Based on 10 Code of Federal Regulations (CFR) Part 100, the closure remedy is intended to be designed to withstand an earthquake with a 2,475-year return period using guidance in ASCE-7. To meet the design parameters, Haley & Aldrich, Inc. (Haley & Aldrich) conducted work under this PDI including an assessment of the potential for surface deformation and faulting, preliminary review of liquefaction potential, and stability of the adjacent slope extending downward to both Cooling Pond and Sphagnum Bog. The analysis and results from this PDI will be incorporated into the containment wall design as a part of the 30% Remedial Design (30% RD).

2 Summary of Work

The scope of work completed as part of this PDI included:

- Drilling of six (6) bedrock borings for cross-hole geophysics. These bedrock boreholes were drilled 10 to 15 feet (ft) apart in a straight line for the completion of cross-hole seismic testing. The boreholes were drilled in two sets of three-hole arrays for cross-hole seismic testing. Note: Additional information on the installation of the bedrock borings can be found in the HB Summary Report and Appendix A – HB-1 Summary Report.

- Performance of cross-hole seismic testing (completed by Geophysical Applications) in general conformance with the ASTM D4428/D4428M-14, “Standard Test Methods for Crosshole Seismic Testing.” Note: Additional information on cross-hole seismic testing of the bedrock borings can be found in Appendix A – HB-1 Summary Report.

- Development of site-specific bedrock ground motions under the design earthquake using information provided by the U.S. Geological Survey Earthquake Hazards Program.

- Performance of a kinematic analysis to determine seismically induced wall bending moments.

- Preliminary evaluation of liquefaction potential of soils at the HB. This consists of simplified evaluations based on the PGAM (site adjusted ground surface acceleration) from generic site class or site-specific evaluations to reduce PGAM.
- Performance of pseudo-static slope stability analyses for the slope adjacent to the HB (based on seismic loading of 0.5*PGAM from generic site class or site-specific evaluations to reduce seismic loading). Note: The slope stability analysis is discussed in greater detail in Appendix D – HB-4 Summary Report.

An overview of activities is described in the following sections. Specific information pertaining to bedrock borehole installation, borehole geophysics field collection, sampling, and standard work procedures can be found in greater detail in the HB Summary Report. Boring locations are shown on Figure 1 of *HB Summary Report*, borehole logs are included in Exhibit HB1-2 of *Appendix A – HB-1 Summary Report*.

2.1 FIELD SHEAR WAVE VELOCITY DATA COLLECTION

In each of the three-(3) hole arrays (South Array and West Array), cross-hole seismic testing was performed to measure compressional-wave (P-wave) and shear-wave (S-wave) velocities in overburden and bedrock. These arrays were drilled and installed near the proposed containment wall that will be constructed and keyed into glacial till or bedrock. The cross-hole seismic survey was conducted by Geophysical Applications, Inc. in conformance with ASTM standard D4428-14, with some minor modifications as described below. In addition, full-waveform sonic logging of the bedrock intervals was completed. Details of the survey are included in Exhibit HB2-1.

The equipment utilized included Geostuff model BHG-2 and BHG-3 three (3)-component geophones, mechanically clamped into each borehole by an expandable metal arm. The three (3) geophone elements in each clamped geophone assembly were oriented in three (3) orthogonal directions (e.g. X, Y, and Z axes). Seismic energy was generated by a pneumatically clamped reversible hammer. The hammer included a packer assembly that expands to fit snugly inside the borehole and a sliding hammer that can impact the packer via either upward or downward blows. This allows reversing the polarity of S-waves and facilitates identification of the S-wave arrival times. An accelerometer affixed to the packer assembly triggers the engineering seismograph (ABEM Terraloc Mark 6) to begin recording.

Crosshole seismic data was recorded at 5-ft depth (or elevation) increments, per the American Society for Testing and Materials (ASTM) standard, to a depth of 150 ft below ground surface. In this case, the data collection began at the deepest test location, and the geophone/source assemblies were then raised by 5-ft intervals for each subsequent test. Data reduction was accomplished in a manner consistent with the ASTM standard, using Excel spreadsheets that calculate both the raypath distances between adjacent boreholes at each test depth (using the verticality observations described below) and P/S-wave velocities (by dividing the raypath distances by the measured seismic-arrival times). Seismic arrival-time measurements were obtained either directly from the ABEM seismograph (using its built-in software) or Rimrock Geophysics' SIPT seismic-processing software.

The verticality of each borehole was evaluated prior to crosshole-seismic testing, as part of the borehole geophysics (described in Appendix A – HB-1 Summary), with one of the televiewer logging probes (ALT model ABI40 or OBI40) that was utilized during the bedrock-borehole logging. These probes contain triaxial magnetometers and triaxial accelerometers to track borehole deviation from vertical and magnetic north. The televiewer logs were recorded at 0.015-ft depth increments, throughout the accessible depth range of each borehole.

The boreholes were arranged in a straight line, but the verticality of each borehole was required to be determined so that the actual raypath distance between each borehole (at each test depth) is known. Typically, boreholes deviate somewhat from vertical, and that deviation can result in significant lengthening or shortening of the inter-borehole separation distances, versus the 12- or 15-ft spacings at the ground surface at the NMI locations.

Full-waveform sonic (FWS) velocity logging was performed at each borehole in each of the three-hole arrays, prior to the crosshole seismic measurements. A Mount Sopris model 2SAA-1000 full-waveform sonic probe was used to provide these data. This probe included a single transmitter, and two (2) receivers. The two (2) receivers allowed measurement of P and S-wave interval velocities (i.e., between the two (2) receivers). A 3-ft long rubber acoustic-isolation section between the transmitter and receiver portions of the probe assured that seismic velocities were measured via the formation around the borehole, and not simply through the probe body itself.

FWS data was recorded at 0.3281-ft (0.1-meter) depth intervals, with a logging speed of 8 ft per minute. The transmitter was set to produce a 20 kilohertz (kHz) output signal, to optimize velocity measurements in the bedrock portion of each borehole. Fixed gain control was utilized during the downward run, and automatic gain control (AGC) was utilized during the upward run. Functional operation of the FWS transmitter was checked prior to each logging run (it will produce an audible clicking sound when the probe is aboveground). Post-survey data reduction (to calculated P- and S-wave velocities versus logged depth) were completed by Geophysical Applications, with a full-waveform sonic-velocity module in ALT's WellCAD software. The resulting sonic-velocity data is included in Exhibit HB2-1.

2.2 BEDROCK GROUND MOTIONS

Kaklamanos Consulting, LLC developed a suite of input bedrock ground motions using the guidelines in ASCE-7. Consistent with these guidelines, bedrock ground motions were provided for the risk-targeted maximum considered earthquake (MCE_R) which corresponds to a 1% collapse risk in 50 years and were developed from the U.S. Geological Survey seismic hazard maps for a 2% probability of exceedance in 50 years (i.e., a 2,475-year return period). Details of this analysis are included in Exhibit HB2-2.

The MCE_R bedrock response spectrum was calculated for Site Class A (hard rock) conditions at the project location. Site Class A conditions are generally representative of bedrock conditions in the Central and Eastern United States. The MCE_R response spectrum for Site Class A was used as a target response spectrum for the selection of input bedrock ground motions. The deaggregations of the seismic hazards were then calculated using the USGS website to determine the magnitudes and distances of earthquakes that contribute most to the seismic hazard at the project location. A set of bedrock ground motions was selected and scaled to match the MCE_R target response spectrum using the Pacific Earthquake Engineering Research Center (PEER) NGA-East database.

A suite of 11 input bedrock ground motions (time histories of acceleration) was provided by Kaklamanos Consulting to Haley & Aldrich for use in kinematic analysis of the containment wall and other seismic evaluations (e.g., site response analysis).

3 Deviations from Work Plan

There were no significant deviations from the Work Plan. The analysis to be conducted for evaluating loads to the containment wall due to ground motions will be documented in the 30% RD.

4 Results

4.1 BOREHOLE GEOPHYSICS

As described above, the details of the borehole geophysics investigation, excluding the verticality measurements used for the field compressional and shear wave velocity calculations, is included in Exhibit HB1-2 in Appendix A – HB-1 Summary.

4.2 FIELD COMPRESSIONAL AND SHEAR WAVE VELOCITIES

At the South Array, P-wave velocities ranged from 941 ft/s to 19,518 ft/s, and S-wave velocities ranged from 667 ft/s to 8,541 ft/s. No S-wave velocities were measured from 5 to 30 ft depth and at 85 ft depth. The average s-wave velocity of the top 100 ft (V_{s100}) for the South Array data is likely greater than 600 ft/s, which corresponds to the lower end for Site Class D conditions if soils are not liquefaction susceptible (which will be determined during design calculations).

At the West Array, P-wave velocities ranged from 1,036 ft/s to 21,935 ft/s, and S-wave velocities ranged from 836 ft/s to 11,996 ft/s. No P-wave velocities were measured at 5 and 80 ft depth. No S-wave velocities were measured from 5 to 10 ft depth and at 80 ft depth. The V_{s100} for the West Array data is likely greater than 600 ft/s which corresponds to the lower end for Site Class D conditions if soils are not liquefaction susceptible.

4.3 SEISMIC ANALYSIS

Based on the subsurface information and s-wave velocity data, Site Class D conditions can be assumed for the project site. For Site Class D, the MCE_G design accelerations are:

- PGA = 0.109 g;
- F_{PGA} = 1.582; and
- PGA_M = 0.172 g.

Where:

- PGA is the mapped MCE_G peak ground acceleration;
- F_{PGA} is the Site coefficient;
- PGA_M is the Site adjusted ground surface acceleration; and
- g is the acceleration due to gravity.

The generic (code-based) MCE_R seismic design parameters for the site for Site Class D conditions are:

- S_s = 0.214 g;
- S_1 = 0.070 g;
- F_a = 1.6;
- F_v = 2.4;
- S_{MS} = 0.342 g;

- S_{M1} = 0.168 g;
- S_{DS} = 0.228 g; and
- S_{D1} = 0.112g.

5 Summary of Future Design Considerations

5.1 CONTAINMENT WALL

Results of seismic analyses described above will be used in kinematic analyses performed to evaluate seismically induced bending moments within the containment wall during the design earthquake. The kinematic analyses will be used to assist with structural design of the wall, including developing recommendations for minimum backfill strength, minimum wall thickness, potential use of plastic concrete backfill that can accommodate bending, and the need for reinforcing in the wall. Backfill, in the context of the containment wall, will be the proposed mix identified to meet the design criteria (described in more detail within Appendix C – HB-3 Bench Scale Testing of Slurry and Wall Mix Designs). The wall will be constructed under slurry with 100 percent replacement of excavated material.

5.2 LIQUEFACTION POTENTIAL

The PGA_M developed for the site will be used to confirm that soils at the Holding Basin are not susceptible to liquefaction under the design earthquake with the calculated seismic demand. The minimum required factor of safety against liquefaction is assumed to be 1.10. If the site soils are found to be liquefaction susceptible, site-specific response analysis is required under ASCE 7.

5.3 GLOBAL STABILITY ANALYSES

One-half of the PGA_M developed for the site will be used in pseudo-static global stability analyses to evaluate slopes adjacent to the Holding Basin (extending downward to the Cooling Pond and bog) under the design earthquake.

For preliminary pseudo-static global stability evaluations, the seismic load will be calculated using a horizontal seismic acceleration equal to 0.086 g, which is 50% of the PGA_M (0.172 g). If the soils at the site are found to be liquefaction susceptible in the previous step, the seismic load (i.e., PGA) and soil strength parameters (e.g., liquefied parameters) will be updated to consider the results of the site-specific response analysis. A site-specific response analysis could potentially lower the seismic load to a point that soil liquefaction or slope instability problems are eliminated.

For the design of the containment wall, kinematic analysis will be performed to estimate bending moments due to the curvatures imposed by the earthquake motions. Test boring and S-wave velocity data will be used to construct idealized soil profile/s and estimate the dynamic soil properties. The bedrock ground motions will then be used together with the idealized soil profile and containment wall properties in a soil-structure interaction analysis to calculate the seismically induced bending moments.

Former Nuclear Metals, Inc. Superfund Site
Holding Basin Vicinity
Concord, Massachusetts

Office: 617-886-7338
Email: MKelley@haleyaldrich.com

Dear Mr. Kelley:

Geophysical Applications has performed crosshole-seismic surveys to help characterize subsurface conditions at the above-noted site. Fieldwork was performed at two arrays, located adjacent to the south and west sides of the former holding basin. Each array consisted of three boreholes drilled in approximately a straight line.

The purpose of this study was to measure the compressional (P) and shear (S) wave velocities that can help determine in situ engineering properties for near-surface geologic materials.

The crosshole seismic method, and results of this survey, are described below.

SURVEY CONTROL

The crosshole array located south of the former holding basin included the following three boreholes (approximate total depths within each PVC-cased borehole are in feet below ground surface):

GP-101 (142.7 feet)

GP-102A (151.9 feet)

GP-103 (152.0 feet)

The array located west of the former holding basin included the following three boreholes (approximate total depths are in feet below ground surface):

GP-104 (154.5 feet)

GP-105 (156.6 feet)

GP-106 (153.0 feet)

Ground and casing-top elevation differences between these wells were measured with a Pentax electronic theodolite and a fiberglass leveling rod. Horizontal distances between adjacent boreholes at each array were measured with a fiberglass measuring tape.

The depths of the seismic source device (a pneumatically-clamped packer/hammer assembly) and receiver geophones were measured using fiberglass measuring tapes. Geophone depths in the receiver boreholes were adjusted using the previously-measured top-of-casing elevations, so as to have the seismic source and geophones at the same elevation, for each test depth in each array.

METHODS OF INVESTIGATION

Crosshole seismic measurements allow measurement of in situ P- and S- wave velocity values for shallow fill, overburden and bedrock. This geophysical technique is well described in published literature and an ASTM testing standard. The current ASTM standard for this test is D 4428/D 4428 M – 14. This document describes equipment requirements, borehole preparation, data reduction and interpretation, as well as other details for this type of testing. The crosshole seismic survey described in this report was planned and performed mostly in accordance with this ASTM standard.

The spacing between the source and closest-receiver boreholes was increased slightly from the ASTM recommendation of 10 feet, to help measure P-wave arrival times in what was expected to be relatively high-velocity bedrock. The inter-borehole spacing at the south array was approximately 11 feet; the inter-borehole spacing at the west array was approximately 12 feet.

Each borehole was completed with three-inch diameter PVC casing. Per the ASTM Standard, rigid grout coupled the PVC casing to bedrock, in the deeper portions of each borehole. Non-rigid grout was used between the PVC casing and overburden at shallower depths.

The ASTM standard states that borehole deviation surveys may not be necessary if borehole deviations of less than 1 foot are assumed or anticipated, and the borehole depths do not exceed 40 feet. This limited borehole deviation would result in velocity estimates that are within $\pm$ 10% of actual velocity values. For the present study, with borehole depths of approximately 150 feet, a verticality survey was required.

Prior to conducting the crosshole-seismic testing, a verticality survey was conducted within each borehole to determine the actual horizontal distance between boreholes at each crosshole test elevation. This information accounts for normal borehole drift that occurs during the drilling process. Verticality data was obtained using a Mount Sopris model 4MXB geophysical logging winch, an Advanced Logic Technology (ALT) model OBI40-MK4 optical televiewer probe, and an ALT ABox electronics console. The OBI40 probe contains triaxial accelerometers and triaxial magnetometers that allow calculations of a borehole's orientation with respect to both vertical and magnetic north. The probe was centralized in each borehole, and verticality data were acquired at 0.007-foot depth intervals.

Verticality data analysis was accomplished using a deviation module in ALT's WellCAD software package. That software calculated eastings, northings, and true vertical depth (TVD) coordinates for each borehole at each sample depth. Inter-borehole distances were subsequently calculated in an Excel spreadsheet, using a formula provided in the ASTM Standard, at each of the crosshole-test depths.

During crosshole testing, seismic energy was generated with a mechanical "packer" energy source constructed by Geophysical Applications. This tool is a bi-directional mechanical hammer that allows the input of seismic energy with both upward and downward hammer blows. This packer assembly is pneumatically-clamped to the borehole interior, and provides significant advantages for interpreting the arrival of S-wave energy; by reversing the direction of energy generation, the S-wave polarity is reversed. Because the S-wave can thus be uniquely identified on seismograph recordings, more-accurate shear wave arrival time measurements can typically be accomplished.

Seismic data were recorded at 5-foot depth intervals within each three-hole array using an ABEM Terraloc Mark 6 engineering seismograph. Because triaxial geophones are used in each of the two receiver boreholes, each seismogram includes three traces per receiver hole (i.e., one vertical sensor, and longitudinal and transverse horizontal sensors). Mechanically-clamped GeoStuff triaxial borehole geophones were used in each of the two receiver boreholes during this survey. The seismograms were samples at 0.1-millisecond intervals, with a total record length of approximately 100 milliseconds.

The seismograms were subsequently examined to determine the arrival times for P- and S-waves between the seismic source and receiver positions. During this data interpretation process, it was noted that despite the small time-sampling interval, there was little time difference between P-wave arrival times at the two receiver boreholes (apparently due to the relatively high-velocity bedrock). That resulted in calculated velocity values being relatively high, and erratic (i.e., a small difference in traveltime resulted in large variations in calculated seismic velocity values).

Consequently, one borehole at each of the two arrays was logged with a Mount Sopris model 2SAA1000 full-waveform sonic (FWS) probe, in an effort to obtain more-accurate P-wave velocities. The two FWS-logged wells were HA20-GP-103 (south array) and HA20-GP-105 (west array). The FWS logs were obtained in conjunction with the Mount Sopris logging winch and MGX electronics console.

The FWS probe includes one transmitter and two receivers; the receivers are respectively three and four feet from the transmitter. A three-foot long flexible rubber section acoustically isolates the transmitter from the receivers. This probe was positioned near the middle of each borehole by centralizers mounted on the two rigid sections of the probe (i.e., one centralizer on the transmitter section, and another on the receiver section). Note that this device can only be operated in the water-filled portion of a borehole; water is needed to transmit seismic waveforms between the logging probe and the PVC casing.

FWS data were recorded at 0.3185-foot depth increments, with a variety of transmitter frequencies and amplifier gain settings. Within the bedrock portion of each logged well, a transmitter frequency of 15 to 20 kHz (kilohertz) and automatic gain control (AGC) settings appeared to yield good data quality. A lower transmitter frequency (7 kHz) was utilized in the overburden portions of the FWS-logged wells. FWS data-quality within the overburden depth ranges was not always satisfactory, partly due to the PVC casing having higher velocity than the overburden, and partly due to the rapid attenuation of the relatively high-frequency sonic waveforms in the non-rigid grout and overburden. Each waveform (i.e., at each receiver and at each sample depth) was recorded with a hold-off time of 50 microseconds (in bedrock), or 100 or 200 microseconds (in overburden), and 256 samples at 4-microsecond intervals (in bedrock) or 8-microsecond intervals (in overburden). Post-survey data processing (including filtering and stacking the waveforms, semblance analysis, and manual identification of P and S-wave velocities) was performed using a FWS module in the WellCAD software package.

RESULTS

Velocity Calculations

Velocities for P- and S-waves at each array (see Table 1) were calculated via the following process:

1. Crosshole seismogram recordings were reviewed to determine the P- and S-wave arrival times.
   a) P-waves were interpreted as the earliest coherent seismic waveform that could be detected. These are the highest velocity waves, and typically exhibit relatively high-frequency and low-amplitude waveforms.
   b) S-waves were identified by their polarity reversal from the bi-directional seismic energy source. S-waves are typically low-frequency and high-amplitude waveforms.

2. Using the timing scale provided by the digital seismograms, the arrival time was determined for each waveform at each receiver borehole. The waveforms usually appear more clearly on only one or two of the three sensors in each borehole (normally, on the vertical and one of the horizontal geophone elements). Because of the packer device's vertical orientation, shear waves are usually most pronounced on the vertical geophone elements.

3. P- and S-wave velocity values were then computed by dividing the distances between source and receiver boreholes (as calculated from the verticality data), by the arrival time for the P- and S-waves. These calculations were performed in several manners (i.e., using the distances and arrival times between the source and each receiver, and also between each of the two receiver boreholes. In cases where there was disagreement between P or S-wave velocities computed at a specific test depth, the velocity values included in the accompanying table were selected for consistency with adjacent test depths, and a qualitative evaluation regarding whether they were reasonable for the earth materials at that depth.

4. P- and S-wave velocity values measured within bedrock by the FWS probe were substituted for the crosshole measurements, at depths where we judged that the crosshole-derived velocities were geologically unrealistically high or erratic.

Blank cells in this table indicate depths for which a confident seismic arrival time (from the crosshole measurements) or velocity value (from FWS logging) could not be ascertained. In particular, at the shallowest test depths (i.e., likely within fill materials), S-wave arrival times could not always be confidently ascertained.

Near 80 to 85 feet deep at each array, a couple of seismic arrival times could not be confidently identified (possibly due to P or S-waves traveling along refracted paths, instead of directly from the seismic source to the receiving geophones).

1 Introduction

Kaklamanos Consulting, LLC, has undertaken the development of a suite of input rock ground motions for site-specific ground response analyses for the Nuclear Metals, Inc. Superfund site in Concord, Massachusetts. The selected ground motions were optimized within the spectral period range of interest for a holding basin containment wall to be designed. As specified in the work plan dated 4 September 2020, the ground motion development was undertaken in accordance with the Ninth Edition of the Massachusetts State Building Code (2017). The Ninth Edition of the Massachusetts State Building Code consists of amendments to the 2015 International Building Code [IBC] (ICC, 2015); Chapter 16 (Structural Design) contains the seismic provisions relevant to these analyses. In turn, the 2015 IBC largely incorporates the seismic guidelines of ASCE 7-10 design standards (ASCE, 2010). Within ASCE 7-10, the following chapters are needed: Chapter 11 (Seismic Design Criteria), Chapter 20 (Site Classification Procedure for Seismic Design), Chapter 21 (Site-Specific Ground Motion Procedures for Seismic Design), and Chapter 22 (Seismic Ground Motion Long-Period Transition and Risk Coefficient Maps). From the perspective of input motion selection and site response analyses, the ASCE 7-10 design standards are very similar in procedure and form to the more recent ASCE 7-16 design standards (ASCE, 2016).

Consistent with these guidelines, bedrock ground motions will be provided for the risk-targeted maximum considered earthquake ground motion response acceleration (MCE_R), which corresponds to a 1% collapse risk in 50 years. Within ASCE 7-10, Section 21.1.1 (Base Ground Motions) presents the following language relevant to the selection of input (bedrock) ground motions):

> A MCE_R response spectrum shall be developed for bedrock, using the procedure of Sections 11.4.6 or 21.2. Unless a site-specific ground motion hazard analysis described in Section 21.2 is carried out, the MCE_R rock response spectrum shall be developed using the procedure of Section 11.4.6 assuming Site Class B. If bedrock consists of Site Class A, the spectrum shall be adjusted using the site coefficients in Section 11.4.3 unless other site coefficients can be justified. At least five recorded or simulated horizontal ground motion acceleration time histories shall be selected from events having magnitudes and fault distances that are consistent with those that control the MCE_R ground motion. Each selected time history shall be scaled so that its response spectrum is, on average, approximately at the level of the MCE_R rock response spectrum over the period range of significance to structural response.

This language was used to guide the analyses presented in this report. Subsequently, Sections 21.1.2 (Site Condition Modeling) and 21.1.3 (Site Response Analysis and Computed Results) of ASCE 7-10 contain language relevant to the subsequent site-specific ground response analyses in which the provided input (bedrock) motions will be used.

First, the MCE_R bedrock response spectrum was computed for Site Class A (hard rock) at the project location. Note that MCE_R refers to the risk-targeted maximum considered earthquake ground motion response acceleration; the MCE_R spectrum is used as the target response spectrum for the selection and scaling of input motions. Second, deaggregations of the seismic hazards were calculated using the U.S. Geological Survey (USGS) website to determine the magnitudes and distances of earthquakes that dominate the seismic hazards at the project location. Third, a set of ground motions was selected and scaled to match the target response spectrum over the period range of interest using the Pacific Earthquake Engineering Research Center (PEER) NGA-East database (Goulet et al., 2014). These ground motions were selected to represent earthquakes that most greatly contribute to site-specific seismic hazard. To provide a stronger match to the target response spectrum, eleven (11) input motions have been provided in this report, which exceeds the minimum of five rock motions required by ASCE 7-10. These input motions were then converted for compatibility with the program DEEPSOIL (Hashash et al., 2018) that will be used in subsequent site-specific ground response analyses.

2 Target Response Spectrum

The first step in selecting input rock motions is to develop the target response spectrum according to the specifications of the Massachusetts State Building Code (Ninth Edition), IBC 2015, and ASCE 7-10. The ASCE 7-10 guidelines in Section 21.1.1 provide two methods for developing a MCE_R bedrock response spectrum: by multiplying the design response spectrum by 1.5 (Section 11.4.6), or by performing a site-specific probabilistic seismic hazard analysis (Section 21.2). The former procedure is used herein.

A MCE_R response spectrum represents the risk-targeted maximum considered earthquake ground motion response acceleration, which corresponds to a 1% collapse risk in 50 years (Luco et al., 2007). Ground-motion values consistent with the MCE_R are provided in ASCE 7-10, and they correspond to 1.5 times the design-level ground motions (ASCE, 2010). It is important to note that the MCE_R bedrock response spectrum, not the design-level response spectrum, is used as the target spectrum for ground-motion selection. The MCE_R ground-motion values in ASCE 7-10 are derived from the 2008 United States Geological Survey [USGS] seismic hazard maps (uniform hazard spectra) for a 2% probability of exceedance in 50 years (Petersen et al., 2008), corresponding to a return period of 2,475 years. To derive the MCE_R ground motion values in ASCE 7-10, the 2008 USGS seismic hazard maps are adjusted for the maximum direction of horizontal shaking rather than the geometric mean, and further adjusted using a risk coefficient to convert the ground-motion hazard spectrum into a risk spectrum (Zimmerman et al., 2017).

The procedure for computing the MCE_R bedrock response spectrum, as presented in Section 11.4 of ASCE 7-10, may be summarized as follows:

1. Determine the mapped MCE_R spectral response acceleration parameters (S_S and S_1) that represent the seismic hazards at the project location for reference site conditions (Site Class B in ASCE 7-10).
2. Determine the site class that represents bedrock at the project location (here, Site Class A, to be explained shortly).
3. Adjust the MCE_R spectral response acceleration parameters for site class effects (S_{MS} and S_{M1}).
4. Compute the design spectral acceleration parameters (S_{DS} and S_{D1}; equal to two-thirds of S_{MS} and S_{M1}, respectively) and the design response spectrum.
5. Multiply the design response spectrum by 1.5 to obtain the MCE_R bedrock response spectrum.

Mapped MCE_R spectral response acceleration parameters (S_S and S_1)

The mapped acceleration parameters represent the seismic hazards at the project location for conditions consistent with Site Class B: S_S = mapped MCE_R spectral response acceleration parameter at short periods, and S_1 = mapped MCE_R spectral response acceleration parameter at a period of 1 s (assuming 5% damping). Values of S_S and S_1 for ASCE 7-10 are available on the USGS seismic design web services (https://earthquake.usgs.gov/ws/designmaps/) as a function of latitude and longitude for the site of interest. However, the Massachusetts State Building Code overrides the IBC and ASCE 7 by specifying a town-by-town list of S_S and S_1; for Concord, the Ninth Edition of the Massachusetts State Building Code specifies $\mathbf{S_S = 0.214}\boldsymbol{g}$ and $\mathbf{S_1 = 0.070}\boldsymbol{g}$ (Figure 1). For the project location in Concord, Massachusetts (Latitude: 42.4412°, Longitude: −71.4201°), the ASCE 7-10 USGS seismic design web services output provides consistent output (at least to two decimal places). For reference, the full output of the USGS seismic design calculator is available in Appendix A of this report.

Site class for bedrock conditions

Input bedrock motions (acceleration time series) were selected for **Site Class A** (hard rock) conditions, which are representative of bedrock conditions in the Central and Eastern United States (e.g., Hashash et al., 2014). For the hard rock encountered in New England (compared to the much softer rock found in active tectonic regions in the western U.S.), there is no compelling reason to assume any conditions other than Site Class A. Upon review of the boring logs for the project site, the encountered bedrock (largely Assabet Quartz Diorite and Acton/Andover Granite) was described as hard to very hard. According to Table 20.3-1 of ASCE 7-10, the shear-wave velocities in Site Class A materials (hard rock) are expected to exceed 1500 m/s. The shear-wave velocity measurements in bedrock on site (measured by Geophysical Applications, Inc. using the crosshole method) exceed 1500 m/s, reaching up to 2600 m/s in the south array and 3600 m/s in the west array. For all these reasons, Site Class A is the best possible assumption for the bedrock conditions.

Site-adjusted MCE_R spectral response acceleration parameters (S_{MS} and S_{M1})

The site coefficients are used to convert S_S and S_1 from the reference site condition (Site Class B) to the site conditions at the location of interest (here, Site Class A): F_a = short-period site coefficient, and F_v = long-period site coefficient. Tables 11.4-1 and 11.4-2 in ASCE 7-10 [replicated as Tables 1613.3.3(1) and 1613.3.3(2) in the 2015 IBC] provide the site coefficients for different site classes and ground-motion levels. For Site Class A and the mapped values of S_S and S_1, Figure 2 indicates that all site coefficients are equal to 0.8: $F_a = 0.8$ and $F_v = 0.8$. The MCE_R spectral response acceleration parameters adjusted for site class effects (S_{MS} and S_{M1}) are obtained by multiplying S_S and S_1 by the corresponding site coefficient:

$$S_{MS} = F_a S_s$$

$$S_{M1} = F_v S_1$$

Multiplying S_S and S_1 by 0.8, we have: $S_{MS} = F_a\, S_S = (0.8)(0.214g) = \mathbf{0.1712g}$ and $S_{M1} = F_v\, S_1 = (0.8)(0.070g) = \mathbf{0.0560g}$.

Table 11.4-1 Site Coefficient, F_a

Site Class	Mapped Risk-Targeted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration Parameter at Short Period				
	$S_S \le 0.25$	$S_S = 0.5$	$S_S = 0.75$	$S_S = 1.0$	$S_S \ge 1.25$
A	$\boxed{0.8}$	0.8	0.8	0.8	0.8

Note: Use straight-line interpolation for intermediate values of S_1.

Figure 2. Screenshot of the site coefficient tables from ASCE 7-10 (ASCE, 2010).

MCE_R bedrock response spectrum

The design spectral response acceleration parameters are equal to two-thirds of the MCE_R spectral response acceleration parameters adjusted for site class effects: $S_{DS} = \frac{2}{3} S_{MS}$ and $S_{D1} = \frac{2}{3} S_{M1}$. The ASCE 7-10 design response spectrum, which is a plot of the design spectral response acceleration (S_a) versus spectral period (T), is determined by the following piecewise equation, plotted graphically in Figure 3:

$$S_a(T) = \begin{cases} S_{DS}\left(0.4 + 0.6\dfrac{T}{T_0}\right) & \text{for } T < T_0 \\ S_{DS} & \text{for } T_0 \leq T \leq T_S \\ \dfrac{S_{D1}}{T} & \text{for } T_S < T \leq T_L \\ \dfrac{S_{D1}T_L}{T^2} & \text{for } T > T_L \text{, where} \end{cases}$$

the breakpoints between the four regions correspond to $T_0 = 0.2\frac{S_{D1}}{S_{DS}}$, $T_S = \frac{S_{D1}}{S_{DS}}$, and T_L is the long-period transition period provided in Figure 22-12 of ASCE 7-10.

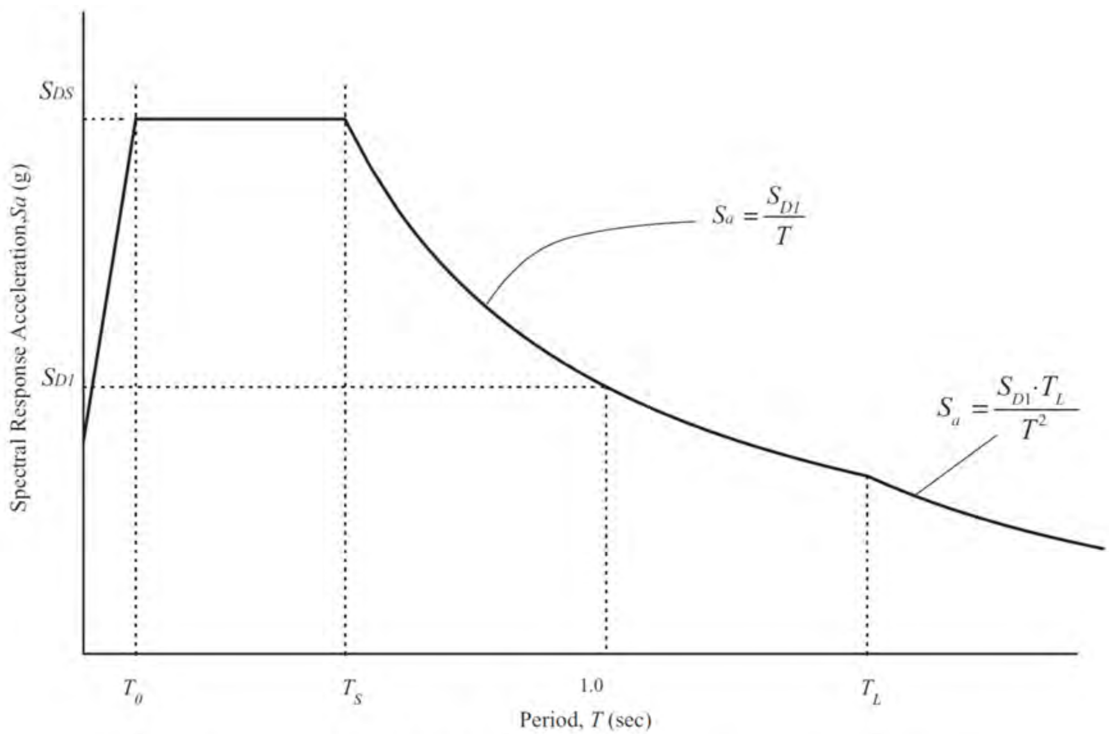

FIGURE 11.4-1 Design Response Spectrum.

Figure 3. ASCE 7-10 design response spectrum (ASCE, 2010).

For input motion selection, however, the MCE$_R$ bedrock response spectrum must be used. The MCE$_R$ response spectrum is determined by multiplying the design response spectrum by 1.5. Multiplying the design response spectrum by 1.5 essentially converts the equation from being written in terms of S_{DS} and S_{D1} to being written in terms of $S_{MS} = 1.5S_{DS}$ and $S_{M1} = 1.5S_{D1}$.

Using the ASCE 7-10 notation for S_{aM}, the site-specific MCE_R spectral response acceleration ($S_{aM} = 1.5S_a$), and multiplying the design response spectrum equation by 1.5, we have:

$$S_{aM}(T) = \begin{cases} S_{MS}\left(0.4 + 0.6\dfrac{T}{T_0}\right) & \text{for } T < T_0 \\ S_{MS} & \text{for } T_0 \le T \le T_S \\ \dfrac{S_{M1}}{T} & \text{for } T_S < T \le T_L \\ \dfrac{S_{M1}T_L}{T^2} & \text{for } T > T_L \text{ , where} \end{cases}$$

the breakpoints between the four regions correspond to $T_0 = 0.2\frac{S_{M1}}{S_{MS}}$, $T_S = \frac{S_{M1}}{S_{MS}}$, and T_L is the same as previously defined. For Concord, Massachusetts, Figure 4 (marked up from Figure 22-12 from ASCE 7-10) indicates that the long-period transition period (T_L) is equal to 6 sec.

Substituting the MCE_R spectral response acceleration parameters for Site Class A bedrock in Concord, Massachusetts, the MCE_R response spectrum may be defined by the following piecewise equation, where S_{aM} is in units of g, and T is in units of seconds:

$$S_{aM}(T) = \begin{cases} 0.0685 + 1.570\,T & \text{for } T < 0.065 \text{ s} \\ 0.1712 & \text{for } 0.065 \le T \le 0.327 \text{ s} \\ \dfrac{0.0560}{T} & \text{for } 0.327 < T \le 6 \text{ s} \\ \dfrac{0.3360}{T^2} & \text{for } T > 6 \text{ s} . \end{cases}$$

The MCE_R peak ground acceleration (PGA) is $0.0685g$, which corresponds to the spectral acceleration at $T = 0$. A plot of the MCE_R bedrock response spectrum (Site Class A) for the project location is shown graphically in Figures 5 and 6 (using logarithmic- and linear-scale axes, respectively) and in numerical form in Table 1 and in the spreadsheet supplied with this report. This spectrum will serve as the target response spectrum for input motion selection and scaling.

3 Deaggregations of Seismic Hazard

The ASCE 7-10 guidelines require that the input acceleration time histories for site-specific ground response evaluations be developed from representative recorded or simulated earthquake motions. These records shall be selected from events having magnitudes and source-to-site distances that are consistent with those that control the MCE_R ground motion, and each selected time history shall be scaled so that its response spectrum matches, on average, the MCE_R rock response spectrum over the period range of significance. Factors that are often considered in input motion selection include (1) the moment magnitudes (**M**) and source-to-site distances (R) of earthquakes that dominate the seismic hazard at the site, (2) the average shear-wave velocity in the upper 30 m of the subsurface (V_{S30}) at the site, and (3) the geologic/tectonic conditions of the region.

Seismic hazard deaggregations, available through the USGS website, allow us to determine the magnitudes and source-to-site distances of the earthquakes that dominate the seismic hazard at the site. Input ground motions can then be selected to be as representative of these magnitudes and distances as possible, although some compromises are ultimately necessary due to the limited range of ground-motion recordings in the central and eastern United States. A deaggregation plot for a uniform hazard spectrum presents the relative contributions of earthquakes with different magnitudes and distances to the seismic hazard at a given location.

For the project site (Latitude: 42.4412°, Longitude: −71.4201°), seismic hazard deaggregations were performed using the USGS Unified Hazard Tool (https://earthquake.usgs.gov/hazards/interactive/index.php) using the "Dynamic: Conterminous U.S. 2008 (v3.3.3)" edition of the seismic hazard maps, to be consistent with the usage of ASCE 7-10. Assuming site conditions of 2000 m/s (Site Class A), computations are available on the website for spectral accelerations at the following seven spectral periods: 0 s (PGA), 0.1 s, 0.2 s, 0.3 s, 0.5 s, 1 s, and 2 s. A time horizon of 2,475 years has been used, because the MCE_R ground motion maps of ASCE 7-10 are derived from the 2008 USGS probabilistic ground motion maps for the 2% in 50 years hazard level (2,475-year return period). Figures 7 and 8 present the seismic hazard deaggregation plots for PGA and 2 s spectral acceleration, respectively; the full deaggregation reports for all spectral acceleration parameters are available in Appendix B of this report.

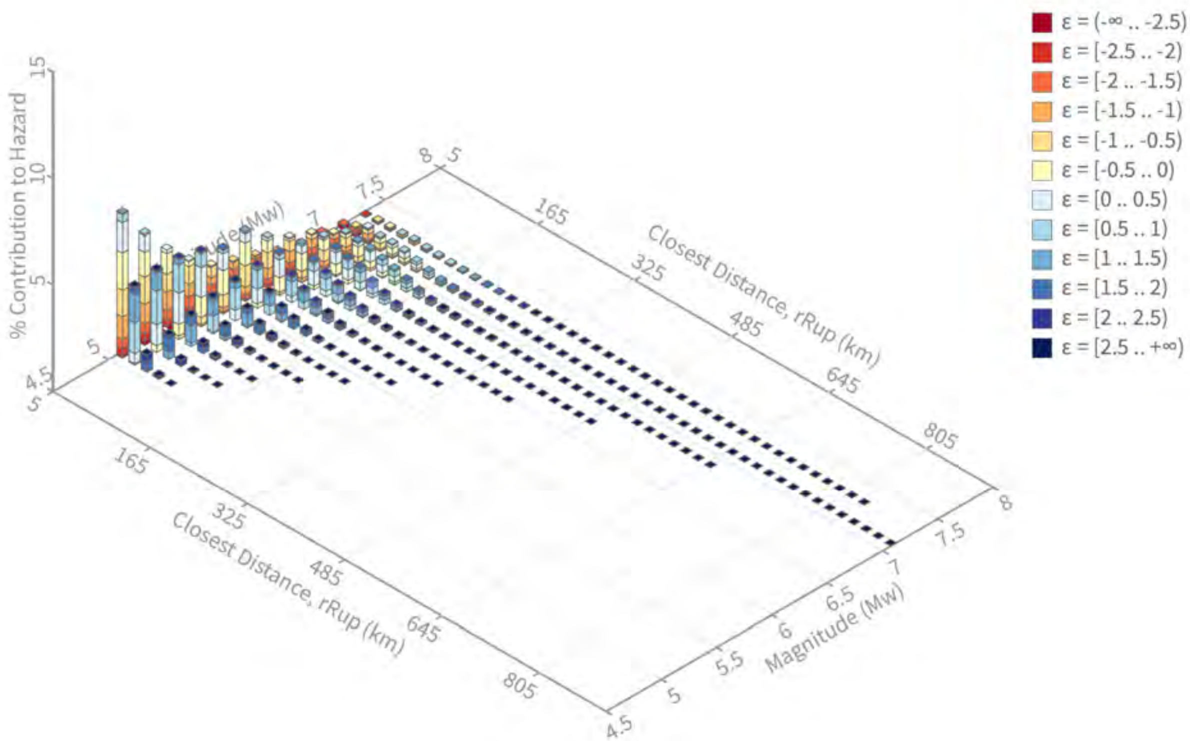

Figure 7. USGS seismic hazard deaggregation for PGA at a return period of 2,475 years for Site Class A at the project site.

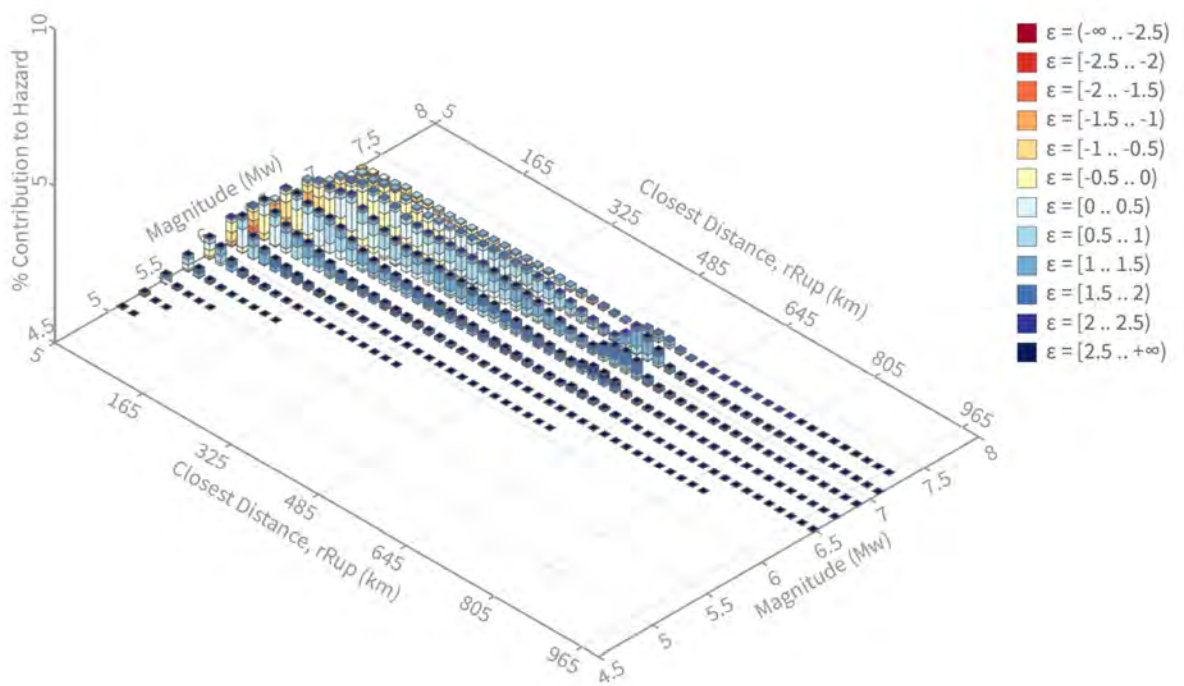

Figure 8. USGS seismic hazard deaggregation for 2 s spectral acceleration at a return period of 2,475 years for Site Class A at the project site.

Analysis of deaggregation plots allow for a determination of the earthquake magnitudes and distances that dominate the seismic hazard, so that appropriate input motions can be selected. The deaggregation plot for PGA (Figure 7) shows that the seismic hazard is dominated by small- to moderate-magnitude (5 to 7), low- to medium-distance (< 100 km) earthquakes. There is no significantly distinguishable contribution to the hazard coming from any particular seismic source; the hazard is dominated by diffuse background seismicity. For longer periods such as 2 s (Figure 8), the hazard is still dominated by low- to medium-distance earthquakes associated with background seismicity, but at slightly larger magnitudes (6 to 7) and longer distances (up to approximately 200 km). However, a noticeable secondary zone of influence at long periods occurs due to the distant earthquakes from the Charlevoix Seismic Zone in the Saint Lawrence Valley, Quebec, having dominant magnitudes of 6.8 to 7.5 and source-to-site distances of 500–600 km.

For the seven spectral accelerations available in the USGS seismic hazard deaggregation tool, Table 2 displays the magnitudes and source-to-site distances associated with the *mean* seismic hazard contribution (across all sources), as well as the *mode* (corresponding to the **M**-R bin with the greatest seismic hazard contribution). For longer spectral periods, the hazard is dominated by slightly larger-magnitude earthquakes at noticeably greater distances. However, significant contributions still occur at smaller magnitudes and distances. In order to encompass the sample space of potential earthquake magnitudes and distances that may affect the site, the bounds of **M** and R used in the input motion selection procedure will be kept as large as possible. Tarbali and Bradley (2016) showed that keeping this bound wide can help to select ground motions with a better representation of the target response spectrum. Stewart et al. (2014) and Haselton et al. (2017) emphasized that magnitude, distance, and site class effects are implicit in the spectral shape of the candidate ground motions, and therefore the shape of the response spectrum should be the primary consideration when selecting ground motions. Ultimately, the analysis of the seismic hazard deaggregations indicate that the seismic hazard at the project site is controlled by a range of magnitudes and distances, and therefore the selection of input motions will encompass a diverse range of **M**-R characteristics.

Table 2. Mean and modal magnitudes and distances from the USGS 2008 seismic hazard deaggregation for seven spectral accelerations at different spectral periods.

Spectral acceleration parameter	Mean		Mode	
	M	R (km)	**M**	R (km)
PGA (T = 0 s)	6.03	54.90	5.1	13.40
Sa(T = 0.1 s)	6.05	57.73	5.1	13.16
Sa(T = 0.2 s)	6.15	70.64	5.1	12.86
Sa(T = 0.3 s)	6.27	87.84	5.1	12.36
Sa(T = 0.5 s)	6.43	117.74	6.1	30.87
Sa(T = 1 s)	6.59	173.30	6.1	30.73
Sa(T = 2 s)	6.72	233.24	6.7	110.39

4 Selection and Scaling of Input Rock Motions

Database of ground motions and search criteria

An important step in the input motion selection process is to identify appropriate databases with representative ground motion recordings from the seismic sources that contribute to the hazard at a site. The NGA-East Database (Goulet et al., 2014), maintained by the Pacific Earthquake Engineering Research Center (PEER), was used to select and scale ground motions to the target spectrum. This database is freely available at https://ngawest2.berkeley.edu and has over 29,000 records from seismic conditions relevant to central and eastern North America. Over 81 earthquake events and 1379 recording stations are represented in the NGA-East database; the earthquakes have magnitudes greater than 2.5, and the source-to-site distances for the records are no greater than 1500 km. The NGA-East Database was selected because it contains ground motions from the tectonic environment in which the project site is located; therefore, the ground motions in the database are similar in character to those that may potentially be encountered at the project site.

The target spectrum developed in Chapter 2 was uploaded to the online PEER NGA-East database search tool, and the search parameters were specified as follows: $3 \leq \mathbf{M} \leq 8$, $R \leq 1{,}000$ km (both source-to-site distance metrics, R_{RUP} [rupture distance] and R_{JB} [Joyner-Boore distance]), and $360 \leq V_{S30} \leq 3000$ m/s. The magnitude and distance bounds reflect the wide range of contributing earthquakes from the seismic hazard deaggregation, and the V_{S30} bounds reflect the stiff underlying site conditions (Site Classes A, B, and C). These search bounds were selected to ensure the range is large enough range to encompass a suitable number of candidate ground motions, while ensuring that the magnitudes, distances, and site conditions are not unreasonable for representing the seismic hazard at the site. However, consistent with the recommendations of Stewart et al. (2014) and Haselton et al. (2017), greater emphasis was placed on adequately matching the target response spectrum than adhering to a rigid range of **M**, R, and V_{S30}.

Period range of interest for the containment wall

The input ground motions should be selected and scaled so that their match to the target response spectrum is optimized over the period range of interest to the structure. The National Earthquake Hazards Reduction Program [NEHRP] provisions (BSSC, 2015) recommend focusing on a period range of $0.2T$ to $2.0T$ for selecting input motions for structural analyses, where T is the elastic fundamental period of the structure. Stewart et al. (2014) recommends the same period range ($0.2T$ to $2.0T$) be used for selecting input motions for site response analyses, because this period range will be important for the overlying structure.

The natural period of vibration representing the fundamental mode of the containment wall was estimated by assuming the wall acts as a cantilever beam, fixed on the bottom and free on the top. This is a reasonable approximation for the natural period of vibration of a cantilever earth-retaining structure (particularly a wall embedded in bedrock at its base), and this method is especially appropriate given that an approximate range of values (not a single precise value) is needed for the matching period range. The theoretical equation for the natural frequency of a cantilever beam is available in a number of textbooks and resources on structural dynamics in different formats. Assuming the wall acts as a fixed-free cantilever beam with a uniform cross-section and material properties, and using the notation of Bakr et al. (2019), the natural frequency f_0 of a cantilever retaining wall may be written as

$$f_0 = \frac{(1.875)^2}{2\pi}\sqrt{\frac{EI}{\rho A H^4}}\,,$$

where E = modulus of elasticity of the material comprising the wall, I = moment of inertia of the wall cross-section, ρ = density of the material comprising the wall, A = area of the wall cross-section, and H = height of the wall. The geometry can be specified for a unit length in and out of the page and written in terms of the wall thickness, t. The moment of inertia of the cross-section may be expressed as $I = \frac{1}{12}(1)(t^3)$, with bending occurring about the thickness of the wall, and the area of the cross-section may be expressed as $A = (1)(t)$. Furthermore, in place of density ρ, this equation may be written in terms of the unit weight of the wall material, γ, and gravitational acceleration, g, where $\rho = \gamma/g$. Inserting these expressions for E, A, and ρ into the previous equation and simplifying, we have:

$$f_0 = \frac{(1.875)^2}{2\pi}\sqrt{\frac{EI}{\rho A H^4}} = \frac{(1.875)^2}{2\pi}\sqrt{\frac{E\left[\frac{1}{12}(1)(t^3)\right]}{\left(\frac{\gamma}{g}\right)[(1)(t)]H^4}} = \frac{(1.875)^2}{2\pi}\sqrt{\frac{Et^2 g}{12\gamma H^4}}\,.$$

Taking the inverse of the fundamental frequency equation, the fundamental period of vibration can then be computed as:

$$T_0 = \frac{1}{f_0} = \boxed{\frac{2\pi}{(1.875)^2}\sqrt{\frac{12\gamma H^4}{Et^2 g}}}\,.$$

The necessary input properties concerning the material of the wall – reinforced concrete – are the unit weight γ, assumed to take a standard value of 150 lb/ft^3, and the modulus of elasticity E. Per the American Concrete Institute (ACI) 318 building code requirements (ACI, 2019), the modulus of elasticity of normal-weight reinforced concrete may be determined from the equation $E = 57{,}000\sqrt{f_c'}$ [psi], where f_c' is the 28-day compressive strength of the concrete. Assuming a range of 4000 to 5000 psi for f_c', a reasonable range of E therefore spans from 3,600,000 to 4,000,000 psi. For the geometric properties of the wall, a wall thickness t of 3–4 ft was assumed per Jean Louis Locsin's email of 1 November 2021. A total wall height H of approximately 75 to 100 ft was determined from analyzing the cross-sections of the containment wall alternatives dated 27 July 2021.

Three estimates of the fundamental period T_0 were computed: (1) a low estimate, using values of the input parameters that tend to decrease T_0; (2) a median estimate, using median or best-estimate values of the input parameters; and (3) a high estimate, using values of the input parameters that tend to increase T_0.

For the **low estimate** of T_0, the minimum height H of 75 ft was used, and the maximum values of E (4,000,000 psi) and t (4 ft) were used because E and t appear in the denominator of the equation for T_0. Inserting these values, a low estimate of T_0 is:

$$T_{0,low} = \frac{2\pi}{(1.875)^2}\sqrt{\frac{12\gamma H^4}{Et^2 g}} = \frac{2\pi}{(1.875)^2}\sqrt{\frac{12\left(150\,\frac{lb}{ft^3}\right)(75\,ft)^4}{\left(4{,}000{,}000\,\frac{lb}{in^2}\right)\left[(4\,ft)\left(\frac{12\,in}{1\,ft}\right)\right]^2\left(32.2\,\frac{ft}{s^2}\right)}} = \mathbf{0.783\ s}$$

For the **median estimate** of T_0, values of the input parameters in the middle of their respective ranges were employed (H = 87.5 ft, E = 3,800,000 psi, t = 3.5 ft). Inserting these values, a median estimate of T_0 is:

$$T_{0,med} = \frac{2\pi}{(1.875)^2}\sqrt{\frac{12\gamma H^4}{Et^2 g}} = \frac{2\pi}{(1.875)^2}\sqrt{\frac{12\left(150\,\frac{lb}{ft^3}\right)(87.5\,ft)^4}{\left(3{,}800{,}000\,\frac{lb}{in^2}\right)\left[(3.5\,ft)\left(\frac{12\,in}{1\,ft}\right)\right]^2\left(32.2\,\frac{ft}{s^2}\right)}} = \mathbf{1.25\ s}$$

Finally, for the **high estimate** of T_0, the maximum height H of 100 ft was used, and the minimum values of E (3,600,000 psi) and t (3 ft) were used because E and t appear in the denominator of the equation for T_0. Inserting these values, a high estimate of T_0 is:

$$T_{0,high} = \frac{2\pi}{(1.875)^2}\sqrt{\frac{12\gamma H^4}{Et^2 g}} = \frac{2\pi}{(1.875)^2}\sqrt{\frac{12\left(150\,\frac{lb}{ft^3}\right)(100\,ft)^4}{\left(3{,}600{,}000\,\frac{lb}{in^2}\right)\left[(3\,ft)\left(\frac{12\,in}{1\,ft}\right)\right]^2\left(32.2\,\frac{ft}{s^2}\right)}} = \mathbf{1.96\ s}$$

The median estimate of the natural period of vibration of the wall is 1.25 s, with a low estimate of 0.78 s and a high estimate of 1.96 s. To keep the period range as wide as possible to encompass these alternatives, while considering the criteria of Stewart et al. (2014), the input motions were selected to match the target spectrum over a period range of **0.2 s to 3.0 sec**. As will be discussed in in the following subsection, spectral periods of 0.04 to 5 sec were ultimately used in the goodness-of-fit calculations, but the heaviest weights were applied in the 0.2 to 3.0 sec range.

Selection and scaling of candidate ground motion records

There are generally two approaches for modifying the time series to be consistent with the target response spectrum: scaling and spectral matching. *Scaling* involves the multiplication of the initial time series by a constant factor, so that the response spectrum of the scaled time series approaches the target response spectrum over the desired period range; and *spectral matching* involves modifying the frequency content of the time series to match the target response spectrum at all periods (Al Atik and Abrahamson, 2010). However, the smooth spectrum derived from spectral matching is not representative of a real ground motion, and therefore spectral matching is not recommended as part of hazard-consistent site response analysis preferred practices (Stewart et al., 2014). Therefore, the scaling method has been used to modify the recorded ground motions to be consistent with the target response spectrum. To ensure the greatest possible match between the recorded ground motions and the target response spectrum, maximum scale factors of up to 15 have been allowed.

Figure 9 displays a screenshot of the PEER NGA-East database with the search criteria employed in this study; a usable period range of 0.02 to 5 sec was selected. To incorporate as many earthquake magnitudes and distances as possible, and to maximize the potential number of records to accurately fit the shape of the target spectrum, the search included records from all portions of central and eastern North America, including both tectonic and potentially induced earthquakes. Because individual acceleration time series are desired, individual components (H1 or H2) were selected as the desired spectral ordinates. Response spectra were computed for a damping ratio of 5%, and the arithmetic suite average method was found to produce the best matches between the target spectrum and the individual response spectra of the input motions. The records were scaled to minimize the computed mean square error (MSE) of each record, as well as the suite average, with respect to the specified target spectrum.

A weighting function was employed such that spectral periods between 0.04 and 5 sec were considered in the MSE calculation. To emphasize the period range of interest to the proposed containment wall (0.2 to 3.0 s), the goodness-of-fit within this range was weighted three times as heavily as the goodness-of-fit at the endpoints of the full range (Figure 9).

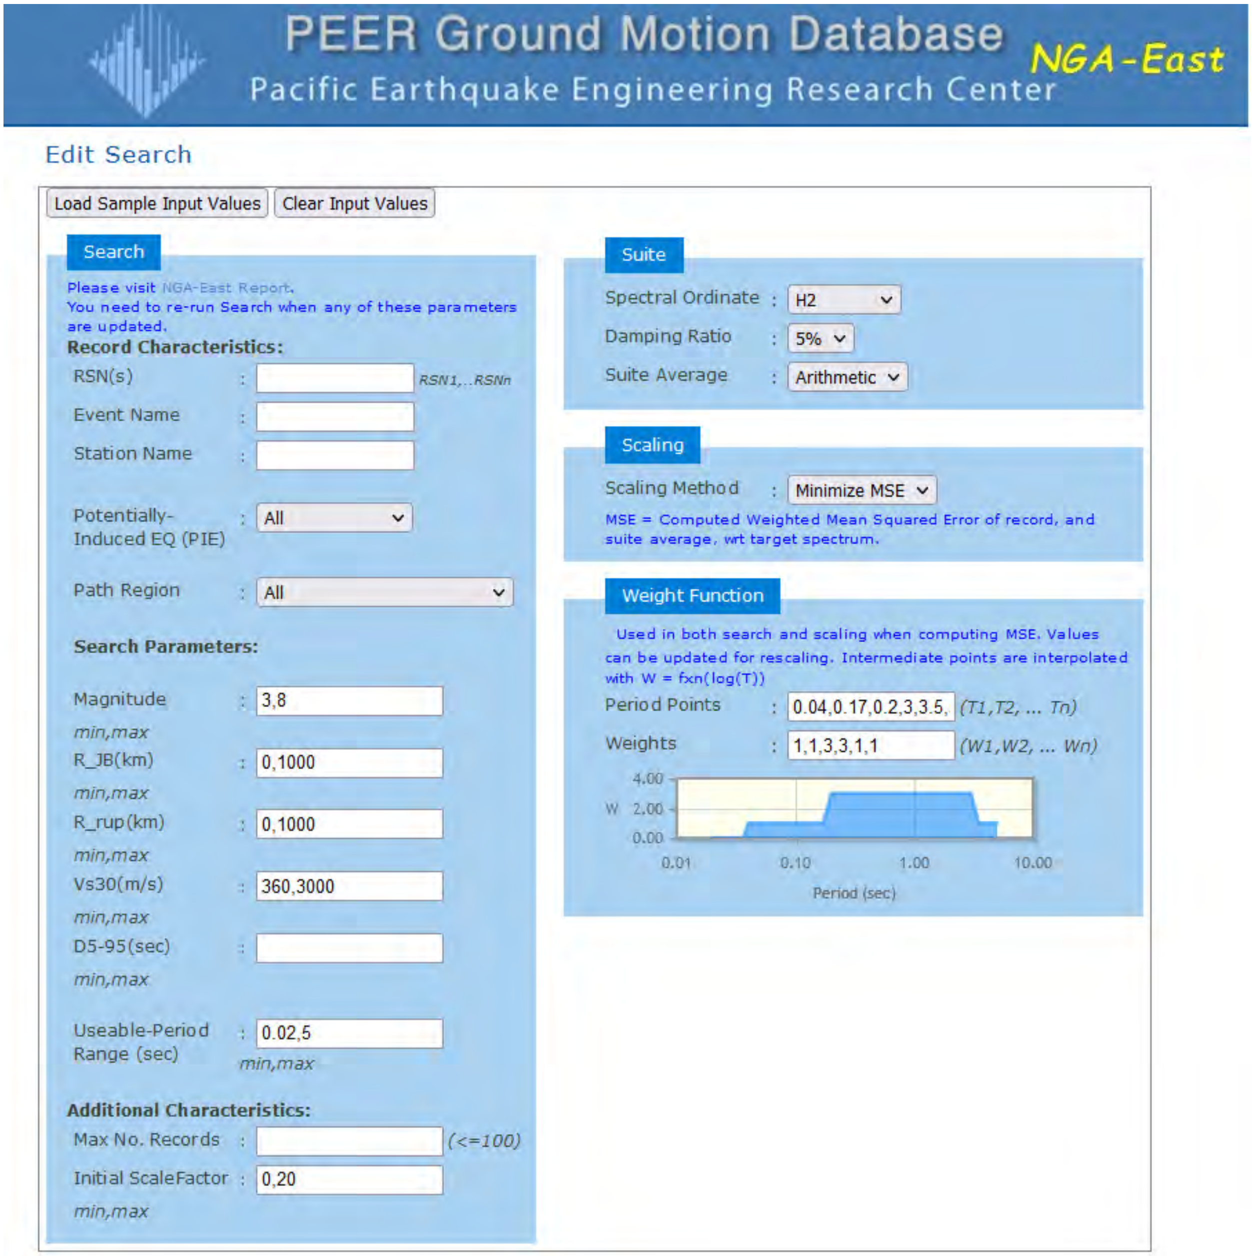

Figure 9. Screenshot of the PEER NGA-East database with the search criteria employed in this study.

After executing the search criteria, twenty (20) candidate ground-motion records were returned, as illustrated in Figure 10 from the PEER NGA-East database query. The suite of H2 components was found to provide a better overall match than the suite of H1 components. Many records appeared to adequately match the target spectrum over the period range of interest (0.2 to 3.0 s). The records were sorted in order of smallest MSE (representing the strongest match between the response spectra of the input motion and the target), and each record was individually inspected for potential inclusion in the final ground-motion suite. Eleven (11) records were ultimately selected to form the final suite of input rock motions. These records tended to provide the strongest fit to the target response spectrum (quantitatively and qualitatively), and consideration was given to select records from as many distinct earthquake events as possible. Records with the most reasonable ground-motion characteristics (in terms of amplitude, frequency, and duration) were prioritized.

Selected suite of input (rock) ground motions

Characteristics of the suite of selected input rock motions are shown in Table 3, and plots of the response spectra (in comparison to the target response spectrum) are given in Figures 11 and 12, plotted using logarithmic and linear scales, respectively. Numerical values of the scaled response spectra for each input motion, along with the median spectral acceleration of the suite, are provided in Table 4. The median is computed as the geometric mean of the natural logarithms of the individual response spectra (which are assumed to be lognormally distributed). The records in the suite are from the 2011 **M** 5.74 Mineral, Virginia, earthquake (4 records); 2011 **M** 5.68 Sparks, Oklahoma, earthquake (4 records); 2010 **M** 5.1 Val-des-Bois, Quebec, earthquake (1 record); 2002 **M** 4.99 Au Sable Forks, New York, earthquake (1 record); and the 1988 **M** 5.85 Saguenay, Quebec, earthquake (1 record).

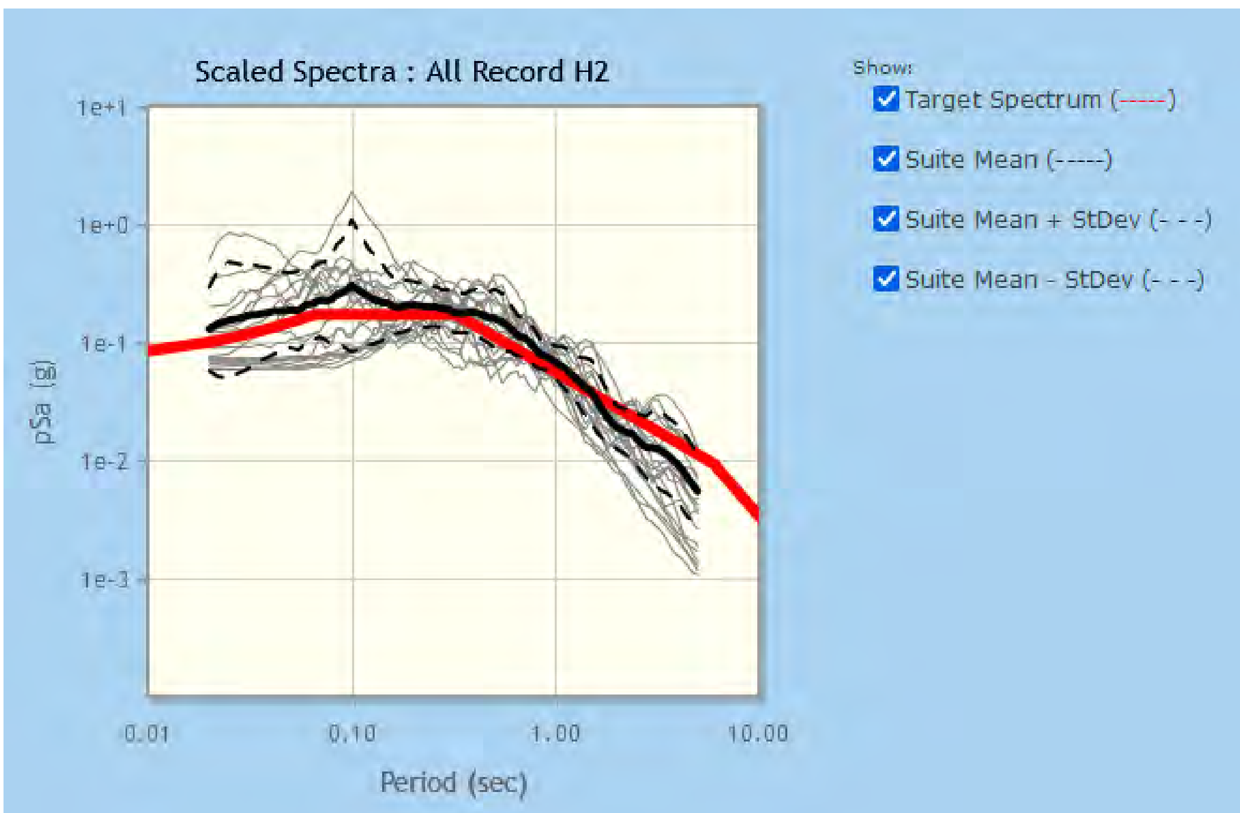

Figure 10. Scaled response spectra for the 20 candidate motions returned from the PEER NGA-East database query to match the target MCE_R bedrock response spectrum. Eleven records were selected from the set of candidate ground motions.

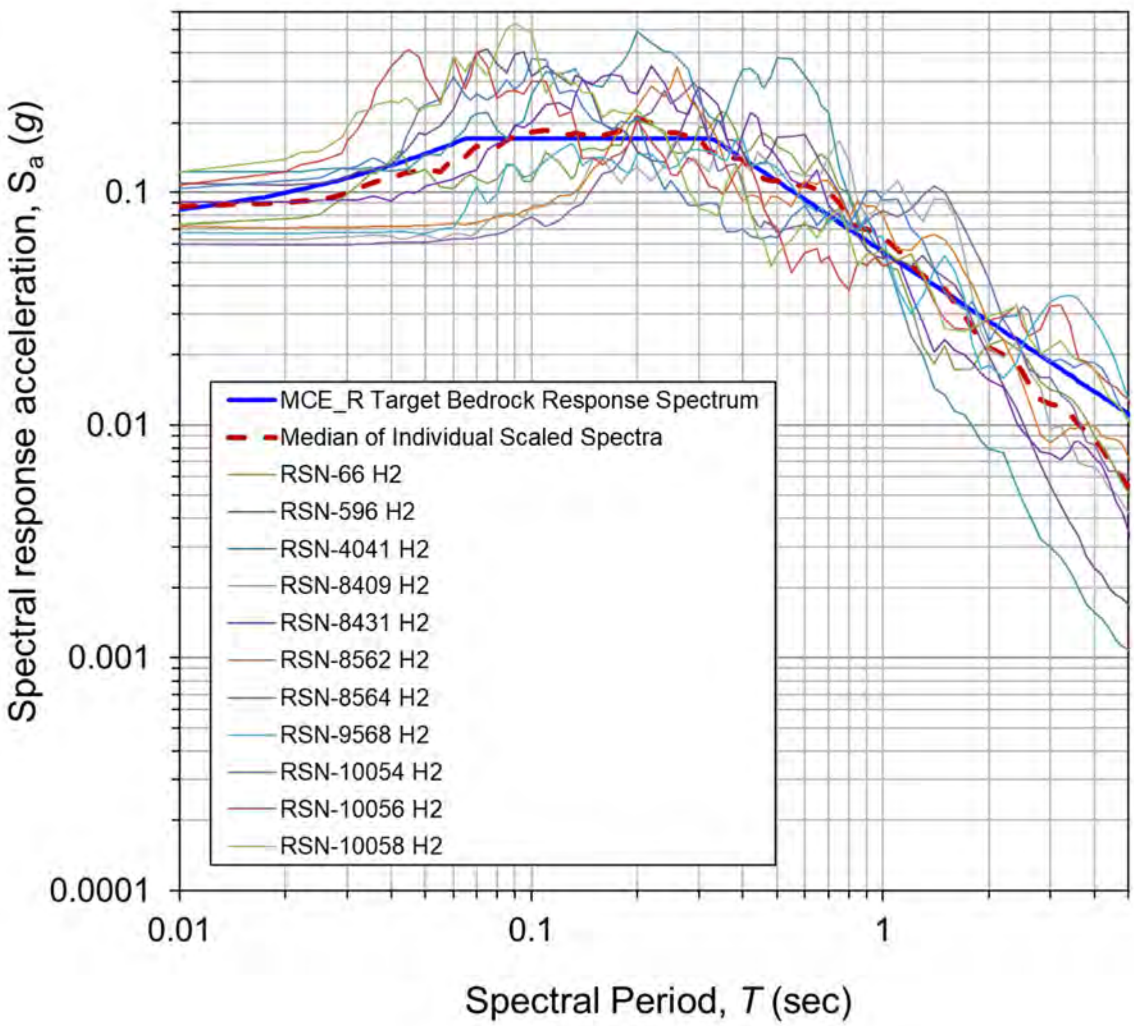

Figure 11. Scaled response spectra for the eleven input (rock) motions in comparison to the target MCE_R bedrock response spectrum (Site Class A), plotted using logarithmic-scale axes.

As observed in Figures 11 and 12, the ensemble of records produces a reasonable match to the target spectrum, especially within the period range of interest of 0.2 to 3.0 s. The fit at shorter periods (T < 0.2 s) is also adequate, although records at longer periods (T > 3 s) tend to have smaller long-period spectral accelerations compared to the target. The drop-off in the response spectra at long periods commonly occurs for ground motions in the central and eastern United States; however, these long periods are not likely to influence the proposed structure to a significant degree.

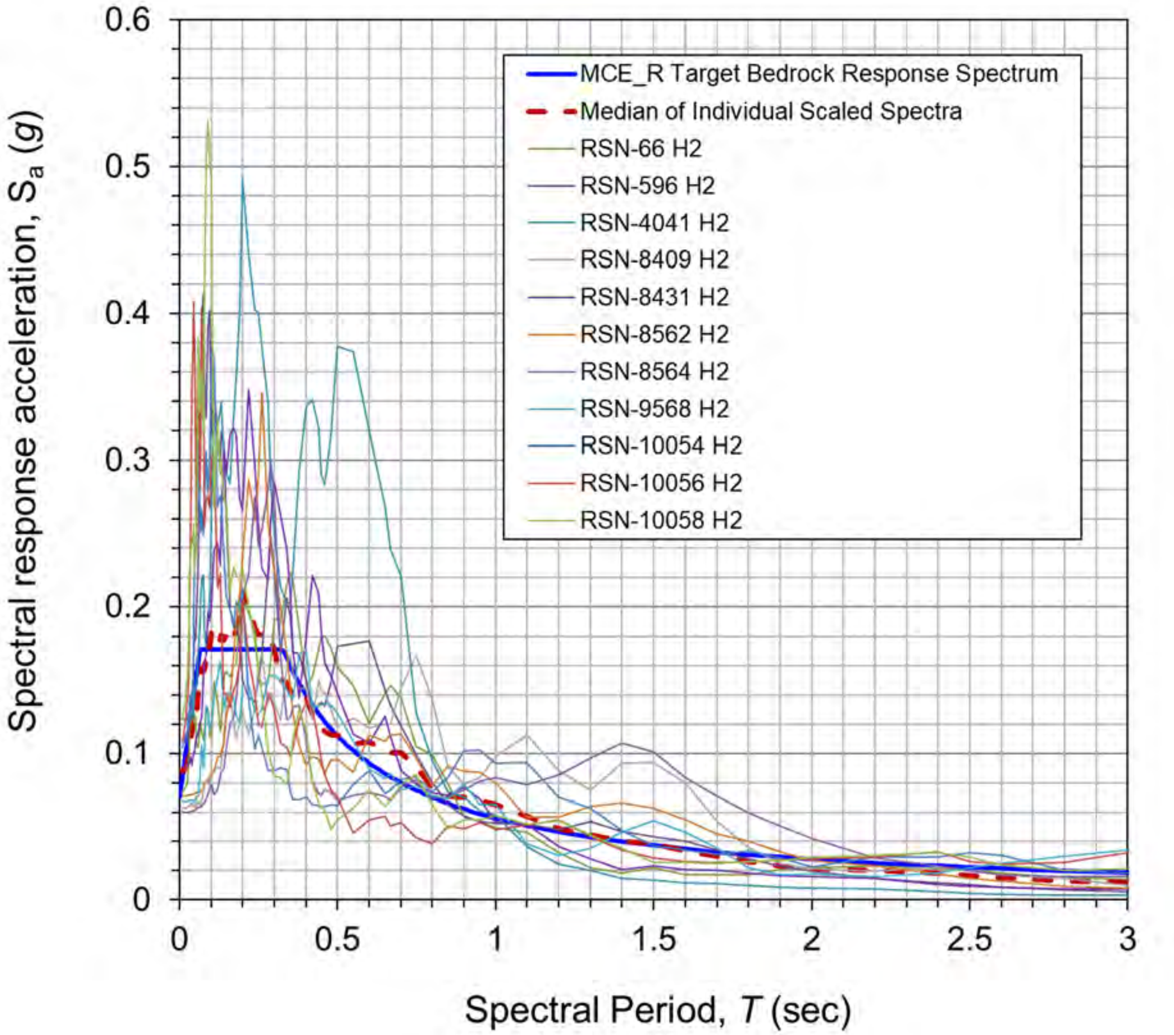

Figure 12. Scaled response spectra for the eleven input (rock) motions in comparison to the target MCE_R bedrock response spectrum (Site Class A), plotted using linear-scale axes.

The ground-motion files downloaded through the PEER NGA-East database are unscaled, processed, as-recorded (unrotated) displacement, velocity, and acceleration trace files. Using the statistical language and environment R (R Core Team, 2021), the acceleration time histories were multiplied by the scale factors in Table 3 and converted into the proper format for DEEPSOIL (one column for time [s], and a second column for acceleration [g]). These ground-motion files, provided with this report, are ready for usage in subsequent site-specific analyses as input (rock) motions in DEEPSOIL. A spreadsheet containing the target MCE_R bedrock response spectrum and the scaled response spectra of the individual acceleration time series has also been provided.

5 Summary and Limitations

This report has been prepared for the exclusive use of Haley & Aldrich, Inc., and their representatives as part of the Nuclear Metals, Inc. Superfund site in Concord, Massachusetts. The analyses in this report were performed in accordance with generally accepted practices in the field, and the conclusions and recommendations in this report are based on the professional judgment and experience of Kaklamanos Consulting, LLC. No warranty or other conditions, express or implied, should be understood.

With the input bedrock motion selection complete, I look forward to assisting with the review of site-specific ground response analyses. Please let me know if you have any questions on this report, and/or if you would like to arrange a meeting to discuss any aspects of this study. I can be reached at (603) 801-2211 or Jim.Kaklamanos@gmail.com. Thank you for the opportunity to partake in this project.

Sincerely,

Kaklamanos Consulting, LLC

By: James Kaklamanos

APPENDIX C

HB-3 - Slurry Wall Mix Designs for Bench-Scale Testing

PDI HB-3: Bench Scale Testing of Slurry and Wall Mix Designs

1 Scope of Work

The purpose of this Pre-Design Investigation (PDI) activity for the holding basin (HB), HB-3, for the containment wall was to investigate the trench slurry mix design and barrier wall concrete mix design needed to meet the HB specific remedial action outlined in the Record of Decision (ROD). Activities performed in accordance with the HB PDI Work Plan (Work Plan) to meet the objectives of this PDI included:

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin	Identify mix design information in support of a performance-based specification for the barrier wall construction. Assist contractors with selection of materials and mix designs as they prepare bids for barrier wall construction.	• Identify potential type and percentage of bentonite to be used in slurry for temporary support of excavated panels for containment wall • Evaluate potential concrete backfill mix designs to satisfy minimum required permeability and strength criteria • Evaluate mix design materials and their potential interactions with radiologically impacted media

Haley & Aldrich, Inc. (Haley & Aldrich) will evaluate potential concrete backfill mix designs to satisfy the minimum required permeability and strength criteria established during the PDIs for the 30% Design.

Agency review and confirmation on proposed hydraulic conductivity requirements summarized in Appendix E, HB-5 Seepage Analysis, is necessary before finalizing mix design selections and completing hydraulic conductivity testing. As such, a literature review of types of mixes and range of hydraulic conductivity achieved is included within this report but laboratory testing on the proposed mix designs has not yet been conducted.

2 Summary of Work

2.1 GENERAL METHODS AND PROCEDURES

Research for the concrete mix design included a literature review with a focus on articles which described individual mix design studies or included general recommendations on concrete mix designs. The articles which included information that was incorporated into the evaluation are listed in the References section of this report.

Work was completed in two parts: a review of mixture additives and a review of applicable mixture additive ratios. The review of mixture additives included gathering information for a variety of commonly used materials including Portland cement, bentonite, blast furnace slag, water, silica fume, coarse and fine aggregates, xypex, and dye (sometimes used to show joint completion). Properties such as the material's effect on hydraulic conductivity, flexibility, ability to contain radiological contamination, longevity, and pH effects were considered. Materials with optimal properties, according to site specific conditions for the HB containment wall, were selected for further evaluation. Longevity considerations are based on the EPA Record of Decision (ROD) criteria specifying that the containment wall should be constructed to be maintained for a minimum of 200 years.

The second part of the concrete mix design research involved looking at various proportions of concrete mixture additives as described in different case studies. Articles reviewed typically provided their mixture additive designs (mix designs) data in terms of cement factor, bentonite percentage, water/cement ratio, and coarse to fine aggregate ratios. For articles that contained hydraulic conductivity results aligning with design criteria, the mix design data was incorporated into a calculations spreadsheet to convert mix design data provided in like-terms for each mix design material. Mix designs were then compared across the seven mix designs summarized in the calculations spreadsheet. The calculations spreadsheet will continue to be updated throughout the design process, but the information reviewed during this PDI is included as Exhibit HB3-1. Mix designs considered for the HB containment wall are described in Section 5.2.

2.2 DESIGN CRITERIA

Design criteria generated during these PDIs (permeability and strength) for the HB containment wall were accounted for when evaluating mix designs.

The permeability or hydraulic conductivity of the concrete containment wall must be smaller than the overburden and rock layers, including the weathered and competent bedrock surrounding it, to effectively contain impacted groundwater in the HB. The results of groundwater seepage modeling discussed in the HB-5 PDI summary report (Appendix E) identified a target hydraulic conductivity of approximately $1x10^{-8}$ to $1x10^{-6}$ centimeters per second (cm/s) for the HB containment wall. Mix design studies evaluated for this PDI achieved hydraulic conductivities in containment walls ranging from $1 X 10^{-10}$ to $1 X 10^{-6}$ cm/s.

Strength results were evaluated as the HB containment wall will need to withstand both static and seismic stresses beneath the ground surface while also being flexible enough to undergo potential seismic deformations. Strength tests typically performed during a mix design test, as observed in the literature review, include confined and unconfined compressive strength tests and axial strain tests. Typically, a triaxial consolidated undrained (CU) test on cylindrical samples is also used to determine strength and permeability data in a laboratory setting. A wide variety of strength results were seen across the mix designs evaluated. A more specific strength requirement for the HB containment wall will be identified during the 30% Remedial Design (30% RD) phase of the project.

2.3 RADIOLOGICAL FACTORS AND OTHER INTERACTIONS

The interactions between the concrete wall and radiological contamination within the HB and other site chemicals was also considered as part of this PDI. A review of mix design studies applicable to radiological sites indicate that the materials and compositions used to contain radiological waste are similar to the materials considered for the HB containment wall, as described in Section 5.1.

Additionally, a preliminary review of potential interactions between chemicals planned for In-Situ Stabilization (ISS, described under separate cover) admixtures and the concrete mixture additives was performed. Phosphates, found in injection admixtures, was identified as having the potential to retard setting of concrete and influence the mechanical properties of the concrete mixture (Jarsosalva Kotatkova, 2017)[1] and will be evaluated during the design.

---

[1] Refer to item 4 in the list of References.

3 Deviations from Work Plan

The research conducted on concrete mix designs allowed Haley & Aldrich to identify potential concrete mixture additives and proportions for the HB containment wall concrete mix as described in Section 4.1. However, the final mix designs and specific materials were not selected for laboratory testing and laboratory testing was not conducted as a part of this PDI, as described in the Work Plan. As strength and permeability criteria for the HB containment wall are more refined throughout the 30% RD phase of the project, the mix designs will be selected, and laboratory tested.

Additionally, the PDI focused more on the containment wall concrete backfill mix design and did not include the slurry mix design for temporary support of excavated panels. The type and percentage of bentonite to be used in the slurry mix will be selected as a part of the 30% RD phase of the project.

4 Results

4.1 CONCRETE MIX DESIGN MATERIALS AND PROPORTIONS

Plastic concrete, which is more ductile than conventional concrete, was a focus of the research and will be considered for the HB containment wall due to its optimal permeability and strength characteristics along with its ability to deform without cracking with the surrounding soils, as opposed to conventional concrete which has an inherent brittleness and is prone to cracks. Plastic concrete consists of aggregate, cement, water, and bentonite mixed at high water to cement ratios, whereas conventional concrete does not typically include a substantial percentage of bentonite. The mixture additives that will be further considered for the HB containment wall are cement, bentonite, coarse and fine aggregate, water, and blast furnace slag. Many mix designs were considered as part of the literature review process and narrowed down based on their similarity to Holding Basin wall site conditions and strength and permeability results. The beneficial characteristics of each material and range of proportions, in percent by weight, seen in the mix design studies cited in the references section are summarized as follows. Seven mix designs that provided clear constituent proportions and permeability and strength results are also presented in the calculation spreadsheet included as Exhibit HB3-1.

- Cement and Bentonite: Typically, the addition of bentonite clay to a concrete mix will increase the ductility and plastic deformation as well as the permeability of the concrete but reduces its shear strength. The ratio of cement to bentonite, often referred to together by weight as the cement factor, should be balanced to maintain strength of the concrete. Cement percentages by weight seen throughout the mix design studies ranged from approximately 4 to 12 % cement. Bentonite percentages by weight seen throughout the mix design studies ranged from approximately 0 to 6%.

- Coarse and Fine Aggregates: Aggregates are an important component of concrete for thermal and elastic properties and provide compressive strength and bulk to the concrete. Coarse aggregates reduce the strain at failure of plastic concrete. Aggregates typically make up the highest percentage by weight across the mix design studies evaluated, with coarse aggregate percentages ranging from 25 to 48 % and fine aggregate percentages ranging from 31 to 42 %.

- Water: Plastic concrete is typically mixed at a high cement to water ratio. Percentages of water by weight seen throughout the mix designs studies ranged from 8 to 42 %.

- Blast Furnace Slag: Slag is shown to reduce permeability of the concrete mix while also helping maintain longer term compressive and flexural strengths. It is usually ground to a certain fineness and used to replace a portion of cement in the concrete mix. Limited studies reviewed during this PDI have used blast furnace slag, so a range of percentages was not obtained.

Several other concrete mix materials were considered, including sulfoaluminate concrete, Xypex, and silica fume. Those materials will not be considered moving forward due to limited information, low availability, or cost.

A summary of the results from the seven mix designs tabulated in the calculation package shown as Exhibit HB3-1 is provided below. The order of mix designs corresponds to the table in Page 3 of the calculation package.

MIX DESIGN	SUMMARY OF MIX DESIGN
Plastic Concrete Cutoff walls for Earth Dams (CIUC Highest Permeability and Highest Strength mix)	• Description: United States Army Corps of Engineers (USACE) study evaluating compression, tensile, and flexural behavior and permeability of plastic concrete for multiple mix designs • Site specific considerations: No radiological contamination; tests were performed in the lab but not implemented at a site • Pertinent Information: Permeability and strength requirements anticipated to be similar to Site.
Comparison of grout mixes and plastic concrete (9th conference on ICSMFE) [Habib 1977])	• Description: A research program comparing triaxial stress-strain-strength relationships and permeability for a specific mix design • Site specific considerations: No radiological contamination; tests were performed in the lab but not implemented at a site • Pertinent Information: Plastic concrete was shown to have a greater strain at failure than grout
Mud Mountain Dam (US Army Corps MMD Research Program)	• Description: USACE installed a plastic concrete diaphragm cutoff wall in the core of 425 ft high dam as a seepage barrier. The site is located on the White River in Enumclaw, Washington. • Site specific considerations: No radiological considerations; wall already installed. • Pertinent Information: Unconfined compressive strength, flexural strength and elastic modulus were shown to decrease with the addition of bentonite to the mix.
Bucknell University research Program (Evans, Stahl, Drooff 1987)	• Description: A research study from Bucknell University specific to plastic concrete wall use for sealing landfills; Nine mix designs were evaluated. Fly ash and bottom ash were used for several of the mixes in addition to standard mix design constituents • Site specific considerations: No radiological contamination; tests were performed in the lab but not implemented at a site • Pertinent Information: Plastic concrete was shown to have a lower permeability and greater resistance to contaminated material compared to other mixes

PDI HB-3: Bench Scale Testing of Slurry and Wall Mix Designs

MIX DESIGN	SUMMARY OF MIX DESIGN
New Conquitlam Dam Plastic Concrete Cutoff Wall (L. Yan, DA Trapp, A Sy, 2008)	• Description: Mix design for the Coquitlam Dam, a 30-meter-high hydraulic fill embankment located in British Columbia, Canada • Site specific considerations: Seismic criteria was considered; no radiological contamination • Pertinent Information: Plastic concrete was selected because it was flexible enough to undergo seismic deformations, without cracking, with the surrounding soils
Durability Aspects of High performance Concretes for Waste Repository	• Description: Mix Design from the Atomic Energy of Canada for disposal of low-level radioactive waste at the Chalk River Nuclear Laboratories in Ontario, Canada • Site specific considerations: Radiological contamination; relies on the durability of concrete for a 500-year service life (compared to 200-years required for Holding Basin wall) • Pertinent Information: The mix designs containing blast furnace slag which replaced Type 50 cement showed the lowest permeability and had the highest resistance to radiological degradation

5 Summary of Future Design Considerations

Approximately five (5) mix designs will be selected for laboratory testing containing varying mix ratios of the materials described in Section 2.1. For Phase I testing, the five (5) mix designs will be submitted to a laboratory for strength and permeability testing. The strength testing will expected occur as a triaxial compressive strength testing on concrete cylinders at ages of 7, 14, and 28 days in accordance with American Society for Testing and Materials (ASTM) D1633-17: Standard Test Methods for compressive Strength of Molded Soil-Cement Cylinders. Laboratory Phase I permeability testing will with potable water from the lab in accordance with ASTM D5084-16a: Standard Test Methods for Measurement of Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter.

The two (2) concrete mixes that achieve permeabilities and strengths most aligned with design criteria described in Section 2.2 during Phase I laboratory testing will be selected for Phase II testing, which will evaluate the mix performance in relation to site conditions at the HB. Phase II permeability testing will use site groundwater obtained from wells at the HB as the permeant. Tests will be run with site groundwater obtained from four (4) different screened intervals (overburden sand and gravel, glacial till, shallow bedrock, and deeper bedrock). The groundwater in some of these screened intervals is anticipated to have low level radioactive impacts, and this additional permeability testing will be performed at a laboratory licensed to handle such materials (Advanced Terra Testing, Inc., Lakewood, CO). As an initial screening of changes in chemistry from the concrete mix, pH and alkalinity of the influent and effluent will be tested during each of these permeability tests.

Results of testing will be included in contract documents to provide contractors with an example of potential mix designs that will achieve design criteria. During construction, contractors will be responsible for preparing a suitable mix design based on materials and admixtures that they propose to use to satisfy the performance-based specification.

ASSUMPTIONS & DEFINITIONS

1. Cement Factor (per cubic yard of concrete): $\dfrac{\text{(Weight of Cement + Weight of Bentonite)}}{\text{Cubic Yard of Concrete}}$

2. Percent Bentonite: Percent of Cement Factor, by weight, which is bentonite = (Weight of Bentonite/Cement Factor)*100

3. Water-Cement Ratio: $\dfrac{\text{Weight of Water}}{\text{Weight of Cement + Weight of Bentonite}}$

4. Average weight of a cubic yard of concrete is 4,050 lbs; This weight is assumed for studies that did not provide a unit weight of their mix (highlighted brown)[3]

UNIT CONVERSIONS

1 lb/ft^3 = 27 lb/yd^3
1 kg/m^3 = 1.6855 lb/yd^3

APPENDIX D

HB-4 - Cover Design and Slope Stability Analysis

PDI HB-4: Holding Basin Cover and Side Slopes of Cooling Pond and Bog Area Summary

1 Introduction

The purpose of this Pre-Design Investigation (PDI) for the Holding Basin (HB), HB-4, was to investigate the geotechnical properties of soils in the HB and at selected transects along slopes of the Sphagnum Bog, Landfill, and Cooling Pond. Activities performed in accordance with the HB PDI Work Plan (Work Plan) to meet the objectives of this PDI include:

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin Cover and Side Slopes of Cooling Pond and Sphagnum Bog Areas	Cover Design and Slope Stability Analysis	• Complete up to four (4) borings into Holding Basin to collect geotechnical data necessary for cover system design. • Complete hand probes to determine organics thickness within Sphagnum Bog, and soft sediment thickness of sediments in Cooling Pond. • Complete hand probes along slopes adjacent to the Holding Basin and Cooling Pond to evaluate near surface soil conditions. • Collect field vane shear measurements on organics located within the bog. • Complete two (2) test pits behind the Gabion Wall south of the Cooling Pond to evaluate the wall cross-section. • Conduct plumbness survey of the Gabion Wall face at up to two (2) transects. • Conduct slope stability analysis for proposed finished grades of Holding Basin Cap and adjacent side slopes, and side slopes adjacent to bog and Cooling Pond.

These areas were investigated to determine subsurface conditions and establish geotechnical parameters to be used in the evaluation of slope stability for existing conditions and conditions during proposed remedial activities at the site. By completing the outlined scope of work, Haley & Aldrich, Inc. (Haley & Aldrich) was able to obtain the following information:

- Characterization of the surficial layers of the slopes to develop surficial subsurface profiles to be used in the slope stability analyses;
- Completion of a slope stability analysis and evaluation of potential need for temporary excavation support during sediment removal along the edge of the Sphagnum Bog; and
- A pre-construction assessment of the Gabion Wall plumbness and condition.

2 Summary of Work

The following explorations and associated soil sampling were completed during or in support of PDI activities for HB-4:

WORK AREA	TASK	EXPLORATION TYPES
Holding Basin	*Geotechnical Data Collection**	Standard penetration test (SPT) borings, with rock coring
Bog**	*Sediment Evaluation***	Hand probing, hand augers, soil sample collection
	*Slope Stability***	
Gabion Wall**	*Test Pits***	Confirmatory excavations at wall locations
	*Slope Stability***	Hand probing, hand augers, soil sample collection
Landfill **	*Geophysical Survey***	GPR and EM surveys
	*Test Pits***	Confirmatory excavations at survey locations
Cooling Pond**	*Piezometers (GW)***	Piezometer installation, groundwater sampling from piezometers, surface water sampling, sediment sampling

Notes:

* Note that although several tasks were previously described in the Work Plan as falling under HB-1, these activities were also associated with tasks and activities to be completed under the PDI activities for HB-4. Therefore, certain tasks related to HB-1 are discussed in this PDI summary for HB-4 (boring installations).

**Note that although several tasks were previously described in the Work Plan as falling under activities conducted as part of Site Wide Soils and Sediment PDI 4 (SSS-4), these activities were also associated with tasks and activities to be completed under the PDI activities for HB-4. Therefore, several tasks related to the Bog and Gabion Wall investigations completed under SSS-4 are discussed in this PDI summary for HB-4 (test pits, sediment evaluations, and slope stability evaluations).

The locations of the explorations discussed in this PDI are presented in Figure HB4-1, Exploration Location Plan.

2.1 HOLDING BASIN BORINGS

Boring installation was described in *Appendix A – HB-1 PDI Summary Report* (PDI HB-1). Work described under HB-1 that generated data used for PDI activities completed as part of HB-4 included:

- Drilling of six (6) investigation borings and installation of continuous multi-level tubes (CMTs) within the six (6) completed boreholes;
- Installation of four (4) observation wells;
- Completion of a series of laboratory tests to evaluate soil and bedrock conditions;
- Drilling of six (6) boreholes for two (2) transects of cross-hole seismic testing; and
- Collection of borehole geophysics data from eight (8) of the drilled boreholes (a combination of the locations completed for CMTs and center location of each of the cross-hole seismic testing transects).

Sampling procedures and American Society for Testing and Materials (ASTM) standards used to perform these borings are included in the HB Summary Report. Exploration locations are shown on Figure 1 of the *HB Summary Report* and Figure HB4-1 attached to this report.

Relevant data can be found in the following attachments to *Appendix A – HB-1 PDI Summary Report*:

- Table HB4-1: A summary of the boring locations, depths drilled, general stratification and observed water levels;
- Table HB1-4: A summary of the analytical laboratory testing performed on the rock cores; and
- Exhibit HB1-6: The results of grain size analyses which were used during estimation of strength parameters from published correlations between material type and corrected N-values.

A summary of historical borings, completed prior to this PDI work and used in slope stability analyses is shown as Table HB4-2.

2.2 HAND PROBES AND HAND AUGERS

2.2.1 Sphagnum Bog

Seven (7) transects (HP-1, HP-4, HP-5, HP-6, HP-7, HP-8, and HP-9) were established along the southern and western edges of the Sphagnum Bog to determine the peat thickness and obtain samples for visual classification and geotechnical laboratory testing.

Prior to probing and sampling at Sphagnum Bog, each proposed location was staked and reviewed for access and general field conditions. Due to the sensitive nature of the Sphagnum Bog material, wooden planks were used as temporary walkways and platforms at the sampling locations to spread contact pressure from foot traffic and to provide a path above standing water where present.

A total of 15 shallow hand probes were performed using solid metal probing rods to measure the peat thickness along transects within the Sphagnum Bog. The probes were advanced to depths ranging between 4 feet (ft) and 11 ft below ground surface (bgs) terminating at depths where either the field personnel could no longer advance the probe, or the top of the underlying sand material was encountered.

Hand augers were subsequently advanced at each probe location to depths ranging between 4 ft and 7 ft bgs. A total of 27 bulk samples of the peat material were obtained for visual classification. Eleven (11) samples were submitted for laboratory organic content testing, mechanical grain size analysis, and hydrometer testing to characterize the peat and underlying sand strata identified in the hand probes.

The transect locations are shown in Figure HB4-1 with hand probes designated by "HP." Subsurface conditions encountered at the hand probe locations are summarized in Table HB4-3. Descriptions of the samples obtained from the hand augers and laboratory test results are provided in Tables HB4-3 and Exhibit HB4-1, respectively.

2.2.2 Slopes

In addition to the seven (7) transects established in the Sphagnum Bog, a total of eight (8) slope transects were established. Two (2) slope transects (TS-1 and TS-2) are located along the western slope of the Sphagnum Bog and six (TS-3 through TS-8) are around the Cooling Pond (including two downslope of the Gabion Walls at the northern end of the pond). Two to three hand augers were performed at each transect to assess the depth of the topsoil and root mat and obtain samples of underlying natural sand deposits.

A total of 22 hand auger explorations associated with these slope transects were advanced to depths ranging from approximately 1 to 5 ft bgs. A total of 40 samples were obtained from the hand augers. Three (3) samples were submitted for organic content testing and 12 samples were submitted for mechanical grain size analysis/ hydrometer testing.

The slope transects and sampling locations are shown in Figure HB4-1, Exploration Location Plan with the identifier "HP." A summary of hand probe depths and observed peat thicknesses from transect samples collected in the Sphagnum Bog are summarized as Table HB4-3. Subsurface conditions encountered at the transects are summarized in Table HB4-4. Descriptions of the samples obtained from the hand augers and results of laboratory testing are provided in Table HB4-4 and Exhibit HB4-1, respectively. Long term slope stability analysis is discussed in Section 5.1 and locations are shown in Figure HB4-2.

2.3 GABION WALLS

Existing Gabion Walls are located on the north and south sides of the roadway leading to the Northern Parking Lot, as shown on Figure 1 of the *HB Summary Report*. The northern Gabion Wall is located on the upper portion of the southeastern slope leading into the Northern Wetland, and the southern Gabion Wall is on the upper portion of the slope at the northern and northwestern edges of the Cooling Pond. Test pits and aerial survey of the Gabion Walls were performed to evaluate the configuration of the gabion baskets that make up the wall and are summarized below.

2.3.1 Test Pits

Three (3) test pits (HA21-TP-104, HA21-TP-108, and HA21-TP-109) were performed behind the existing Gabion Walls to confirm the configuration of the Gabion Wall as identified in historical design drawings. Gabion Wall test pit locations are shown as Figure HB4-3.

The test pits were performed using a track-mounted excavator and were approximately 6 ft wide and 13 to 18 ft long, parallel to the wall alignment, with depths varying between 6 and 9 ft. The test pits were advanced to depths sufficient to expose the top of the third row of rock-filled gabion baskets. Following completion of the test pits, the excavated soil was placed and compacted back into the excavations. Refer to Exhibit HB4-2 for the field logs, sketches, and photos of the test pits.

2.3.2 Gabion Wall Aerial Survey

An aerial drone survey of the southern Gabion Wall was performed by Comprehensive Environmental, Inc. (CEI) in November 2020 to evaluate plumbness (vertical orientation) along the Gabion Wall faces to establish a baseline for future observations. The aerial survey included a topographic survey made using a DJI M201 drone and post-processing imagery outputs including a fly-through video, a 3-dimensional surface model and an orthophoto mosaic aerial image. These images and surveys will be used to compare future visual observations of the southern Gabion Wall and monitor translative and rotative movement.

3 Deviations from Work Plan

Bog transects HP-2 and HP-3, planned for the toe of the Landfill in the Sphagnum Bog, were not completed due to accessibility issues as the transects were located in standing water at the time of sampling.

An additional test pit was completed as part of the Gabion Wall investigation.

Proposed field vane shear testing to measure the shear strength of peat in the Sphagnum Bog was not conducted. The apparent strength of the material was above the applicable range of testing equipment, likely due to the fibrous nature and relatively high sand content of the material.

4 Results

4.1 SUBSURFACE CONDITIONS

4.1.1 Test Borings

The test borings revealed the following strata, with generalized descriptions below in order of increasing depth below ground surface. Strata thicknesses are summarized on Table HB4-1. Refer to Exhibit HB-1 of *Appendix A – HB-1 PDI Summary Report* (PDI HB-1) for the boring logs and Exhibit HB-6 of PDI HB-1 for results of laboratory grain size analyses.

Approximate Range in Thickness, feet	Generalized Description
2 to 22	FILL - Very loose to medium dense, brown, silty SAND (SM).
44 to 68	ICE CONTACT DEPOSITS – Very loose to very dense, poorly-graded SAND (SP), well-graded SAND (SW), silty SAND (SM), poorly-graded GRAVEL with Silt (GP-GM), and sandy SILT (ML).
1.5 to 37	FLOW/GLACIAL TILL – Medium Dense to very dense poorly-graded SAND with silt and gravel (SP-SM), poorly-graded SAND with clay and gravel (SP-SC), silty SAND with gravel (SM), clayey SAND with gravel (SC), and poorly-graded GRAVEL with silt and sand (GP-GM).
---	BEDROCK – Moderately hard to very hard, fresh, fine to very coarse grained ASSABET QUARTZ DIORITE with very hard, fresh, medium to very coarse grained ACTON/ ANDOVER GRANITE. The top of bedrock was encountered at depths of 72 to 105 ft bgs.

4.1.2 Hand Probes on Slopes

The hand probes performed along slope stability transects established the thickness of topsoil or root mat layers along the slope and identified the top of the underlying sand layers. The topsoil and root mats ranged in thicknesses from 0 to 2.0 ft with the thickest root mats typically near the crest of the slope. Natural sand deposits were encountered immediately below the topsoil/root mat layers, with hand auger refusals at depths ranging from 1.0 to 5.0 ft bgs. Cobbles and coarse gravel were observed in the natural sand deposits.

The grain size analyses on the samples submitted from these transects classified the surficial topsoil/root mat materials as clayey SAND (SC), silty SAND (SM) and poorly graded SAND with silt and gravel (SP-SM) with an organic content ranging between 2.1 and 4.3%. The surficial strata of the slope transects are summarized in Table HB4-4**.**

4.2 HAND PROBES IN SPHAGNUM BOG

In the Sphagnum Bog, preliminary probes were first advanced into the peat material to establish the depth of the bottom of the peat which ranged in depth of 4 ft to greater than 11 ft (probe length). Grain size analyses on samples collected from the Sphagnum Bog classified the materials as sandy SILT (ML) and silty SAND with organics (SM), and organic contents were measured to range between 3.8 and 97.2%. Generally, the material grain size decreased and organic content increased with distance into the Sphagnum Bog from the edge (sampling locations B and C). Peat thicknesses and general descriptions along the bog transects are outlined in Table HB4-3**.**

4.3 GABION WALL EVALUATION

4.3.1 Test Pits

The Gabion Wall test pit locations are shown as Figure HB4-3. The Gabion Walls had a width of 3 ft (measured perpendicular to the wall face) at the ground surface and a varying width of 7.5 to 8 ft at the bottom of the excavations. Test pits were discontinued at the top of the third row of baskets. Information regarding the height of the third row of baskets and dimensions of underlying baskets was not obtained from the test pits. The baskets were filled with crushed rock fill and were separated from the backfill with a geotextile filter. Backfill materials behind the gabion baskets generally consisted of a 1 to 1.5 ft thickness of topsoil or pavement sections overlying processed fill consisting of poorly graded SAND (SP) with silt and gravel. Test pit logs and available photographs are included in Exhibit HB4-2.

HA21-TP-104 was completed behind the northern Gabion Wall at the top of the slope into the Northern Wetland. Three (3) rows of gabion baskets were observed. The top row was approximately 3 ft wide by 4 ft tall. The second row was approximately 6 ft wide by 3 ft tall. The third row was approximately 8 ft wide. Excavation was terminated at the top of the third row of baskets. The above-ground height of the face of the wall could not be accurately measured due to organic debris covering the face of the wall. The backfill material had been placed to within 0.8 ft below the top of the gabion wall.

HA21-TP-108 was completed on the western leg of the Gabion Wall at the top of the Cooling Pond slope. Three (3) rows of gabion baskets were observed. The top row was approximately 3 ft wide by 3 ft tall. The second row was approximately 5.5 ft wide by 3.5 ft tall. The third row was approximately 8 ft wide. Excavation was terminated at the top of the third row of baskets. The above-ground height of the face of the wall could not be accurately measured due to organic debris covering the face of the wall. The backfill material had been placed to within 0.5 ft below the top of the Gabion Wall.

HA21-TP-109 was completed on the northern leg of the Gabion Wall at the top of the Cooling Pond slope. Three (3) rows of gabion baskets were observed. The top row was approximately 3 ft wide by 2 ft tall. The second row was approximately 4.5 ft wide by an estimated[1] 3.5 ft tall. The third row was approximately 7.5 ft wide. Excavation was terminated at the top of the third row of baskets. The above-ground height of the face of the

[1] Test pit logs indicate a 7-ft-tall basket. However, based on records assessment and a further assessment of the gabion conditions, it is estimated the basket is approximately 3.5 ft tall.

wall was approximately 15 ft and the backfill material had been placed to within 0.8 ft of the top below the Gabion Wall.

4.3.2 Plumbness

Observations at the Gabion Wall test pits indicated the baskets appeared to be generally intact and the crushed rock fill was contained within the gabion baskets.

The aerial survey from the drone did not indicate a reverse batter of the Gabion Wall in the sections in which the drone could survey. However, the easternmost section of the southern Gabion Wall (nearest HA21-TP-109) visibly leans (reversed batter angle) towards the Cooling Pond; this section could not be surveyed by the drone due to tree cover and will continue to be visually monitored. The drone survey conducted provides a baseline survey of the toe of the wall and the top of the wall that is not obstructed by trees. A subsequent survey can be conducted in approximately one year to evaluate if the wall has moved since completion of the baseline survey.

4.4 SLOPE STABILITY

4.4.1 Shear Strength Parameters

Total and effective shear strength parameters proposed for use in slope stability analyses were established for the Fill (from Holding Basin borings included with HB-1), Ice-Contact Deposits, and Glacial Till from correlations based on the corrected Standard Penetration Test N-Values, material types, and observed conditions at the site.

Given the variety of the N-values in each major stratum and the high efficiency of the hammer, strength parameters were generically assigned to layers with similar densities and consistencies as observed in the field explorations. The parameters of non-organic subsurface materials used in stability analyses were developed using correlations to the lower bound N-values associated with the density and consistency designations:

- Unit weights are based on the relative density and unit weight correlation as presented in An Engineering Manual for Settlement Studies (Duncan and Buchignani, 1976),
- Angles of internal friction are based on the empirical correlation between friction angle of sands and normalized standard penetration blowcount as presented in Soil Mechanics in Engineering Practice (Terzaghi, et.al, 1996), and
- Undrained shear strengths are based on the Relationship between the corrected blowcount and undrained shear strength at presented in Introductory Soil Mechanics and Foundations: Geotechnical Engineering (Sowers, 1979).

The parameters of organic subsurface materials (i.e. peat) used in stability analyses were developed using sources including:

- Kazemian, et. al. (2011), "A state of art review of peat: Geotechnical engineering perspective." International Journal of the Physical Sciences, Vol. 6(8) pp. 1974-1981.
- Rahgozar and Saberian (2016), "Geotechnical properties of peat soil stabilised with shredded waste tyre chips." Mires and Peat, Vol. 18, Article 03.
- Zainorabidin and Mansor (2016), "Investigation on the shear strength characteristic at Malayan Peat." ARPN Journal of Engineering and Applied Sciences. Vol. 11 No. 3.

Shear strength parameters to be used in the drained (long-term) slope stability analyses use the Mohr-Coulomb strength parameters of angle of internal friction, pounds per cubic foot (pcf), “phi,” cohesion “c” and pounds per square foot (psf) are shown below.

Material Type	Moist Unit Weight [Saturated] (pcf)	Phi (degrees)	Cohesion above water [below water] (psf)
Very Loose Existing Fill	100 [107]	24	50 [0]
Loose Existing Fill	108 [115]	28	50 [0]
Medium Dense Existing Fill	115 [122]	30	50 [0]
Dense Existing Fill	122 [129]	32	50 [0]
Very Dense Existing Fill	130 [137]	34	50 [0]
Very Loose Sand	95 [102]	24	50 [0]
Loose Sand	105 [112]	28	50 [0]
Medium Dense Sand	115 [122]	32	50 [0]
Dense Sand	122 [129]	34	50 [0]
Very Dense Sand	130 [137]	36	50 [0]
Glacial Till	135 [142]	40	0 [0]
Loose Silt	105 [112]	28	50 [0]
Medium Dense Silt	115 [122]	30	50 [0]
Dense Silt	122 [129]	32	50 [0]
Soft Peat	85 [92]	16	250 [0]
Vegetative Peat	85 [92]	20	250 [0]
Fibrous Peat	85 [92]	27	250 [0]
Vegetated Ground Surface	110 [117]	28	250 [0]
Landfill Waste	87 [87]	28	250 [0]
Gabion Wall	150 [150]	Modeled as a Rigid Structure – Infinite Strength	

For undrained (short-term) slope stability analyses the coarse-grained materials (such as sands and gravels) are assigned the Mohr- Coulomb strength parameters, as shown above, and the fine-grained materials (such as silts and peats) are assigned an undrained shear strength, as shown below.

Material Type	Moist Unit Weight [Saturated] (pcf)	Undrained Shear Strength (psf)
Loose Silt	105 [112]	500
Medium Dense Silt	115 [122]	1000
Dense Silt	122 [129]	1500
Soft Peat	85 [92]	500
Vegetative Peat	85 [92]	500
Fibrous Peat	85 [92]	500

The strength properties shown above are preliminary based on our initial assessment of subsurface conditions at the site and may be adjusted during design as our analyses are refined.

5 Summary of Future Design Considerations

5.1 LONG-TERM SLOPE STABILITY

As designated in the Record of Decision (ROD), the planned remediation for the HB involves the installation of a containment wall, filling the basin, and capping the filled area. The HB closure and containment wall designs should include an evaluation of long-term slope stability. Slope stability will be evaluated using Slide2 (RocScience, 2020). Slide2 is a computer program that analyzes two dimensional models using slice limit equilibrium methods. Spencer's Method of Slices, which analyzes both force and moment equilibrium, will be used in these analyses. The non-circular autorefine search method and surface optimization will be used to evaluate failure surfaces. The minimum required factor of safety for the long-term closed condition will be 1.5.

Long-term slope stability analyses will include an assessment of post-mitigation conditions at the Gabion Wall at the northern end of the Cooling Pond as well as measures required to achieve the minimum required factor of safety (which may include regrading to the north of the wall and removing upper courses of gabion baskets).

Long-term slope stability analyses will be performed at the locations shown on Figure HB4-2. The slope stability output from an example analysis performed across the HB (at Section HB-D) is shown in Exhibit HB4-3.

Our assessment of long-term slope stability will be for static conditions only. Slope stability for pseudo-static loading under the design earthquake is a short-term loading condition that will be assessed as described in Section 5.2.

5.2 SHORT-TERM SLOPE STABILITY

Mitigation measures at the site will include removing impacted soils in the Sphagnum Bog near the toes of slopes adjacent to the HB and landfill. While the ROD identifies a 3 ft excavation in the Sphagnum Bog, data obtained during the SSS-4 PDI activities will be used to refine excavation limits, with additional consideration given to protecting the Sphagnum Bog area. Impacted soils will also be removed from the Cooling Pond, extending to the toes of slopes adjacent to the edges of the pond. It is anticipated that excavation at the slope toes will be laid back at an angle similar to the existing slope angles (i.e. vertical cuts are not planned at the slope toes).

Short-term slope stability analyses will be performed using the method described above for long-term stability to evaluate impact of proposed excavation on the factor of safety. In many cases the existing natural slopes are relatively steep and will not meet typical safety factors for designed slopes. The intention of the short-term stability analyses is to confirm that planned excavation will not result in significant reduction in safety factor compared to existing conditions and to identify areas where special measures (such as sequencing excavations to be cut and backfilled in short lengths along slope toes) may be required.

Short-term stability analyses will also be performed to evaluate temporary stability of slopes adjacent to the HB extending to the Sphagnum Bog and Cooling Pond under anticipated construction surcharge loading from equipment associated with the containment wall installation. A target minimum factor of safety under temporary construction surcharge of 1.2 is planned for slopes adjacent to the HB.

Short-term stability analyses will also assess pseudo-static loading under the design earthquake. This condition will use undrained soil properties which are appropriate for this short-term loading condition. A target minimum factor of safety under pseudo-static loading of 1.0 is planned.

5.3 GABION WALL NORTH OF COOLING POND

Removal of impacted soils at the Cooling Pond will require excavation of soils downslope from the toe of the existing Gabion Wall at the northern end of the pond. Temporary global stability of the wall will be evaluated for conditions anticipated during excavation. As noted above, removal of upper courses of gabion baskets may be required to achieve the target safety factor.

Visual observation indicates that the Gabion Wall appears to be leaning outward in some locations, compared to drawings indicating the wall face was designed to be battered away from the slope. To help understand potential concerns with stability of the existing wall, additional survey monitoring is recommended for comparison with recent data to help determine if wall movement is continual. Portions of the wall face could not be observed during the recent survey due to the presence of vegetative growth. Clearing of vegetation, from the face of the wall, is also recommended to allow for a more detailed survey of the wall.

HB-5 – Seepage Analysis for Containment Wall Design

PDI HB-5: Seepage Analysis to Evaluate Hydraulic Properties of Wall and Depth of Wall

1 Scope of Work

The purpose of this Pre-Design Investigation (PDI) was to evaluate the seepage of groundwater under and through the proposed containment wall, a component of the prescribed remedy for the holding basin (HB) outlined in the Record of Decision (ROD). Activities performed in accordance with the HB PDI Work Plan (Work Plan) to meet the objectives of this PDI include:

AREA OF INVESTIGATION	PDI OBJECTIVES	PDI SCOPE
Holding Basin	Complete seepage analysis to evaluate hydraulic properties of wall and determine depth of wall.	• Setup SEEP/w (SEEPage for Windows) model with overburden and bedrock aquifer geometry using hydraulic conductivity values from Geosyntec calibrated groundwater flow model as well as data gathered in PDIs HB-1 and HB-4. • Conduct parametric seepage modelling on proposed wall depths and wall hydraulic conductivity to refine design parameters of containment wall.

By completing the outlined scope of work, Haley & Aldrich, Inc. (Haley & Aldrich) was able to conduct a parametric seepage analysis, using a finite element seepage model completed with SEEP/w software, to assess seepage potential within the overburden and bedrock aquifers. The results of the initial model run indicated design parameters for hydraulic and physical properties of the proposed HB wall, including hydraulic conductivity, depth (into till or bedrock), and thickness. The initial model runs completed as part of the PDI are presented herein, and as the design develops the input parameters and geometry of the wall will be adjusted in the model accordingly.

2 Summary of Work

2.1 DEVELOPMENT OF SEEP/W MODEL

A finite element, 3-dimensional model of the site was developed using the SEEP/w software from Geoslope. SEEP/w is a numerical modeling software which allows the user to simulate groundwater flow in cross section. A total of two (2) critical seepage sections were evaluated and transient parametric analyses performed to estimate the minimum wall construction parameters to meet performance criteria.

The data collected from PDI activities described in HB-1 and HB-4 (Appendices A and D of the HB Summary Report), data recently collected by Geosyntec as part of the site-wide bedrock groundwater characterization, and data collected during the remedial investigation (RI) were all used to construct the model. The following site-specific information collected from the other HB PDIs were input into SEEP/w to develop a 3-dimensional model representative of site conditions.

Parameter	PDI
Subsurface Geology: • Stratigraphic Sequence • Depth to Bedrock	HB-1, HB-4

Parameter	PDI
Aquifer Properties (Bedrock and Overburden): • Hydraulic Conductivity • Saturated Thickness	HB-1
Geophysical Properties: • Location of Water Bearing Fractures • Orientation of fractures	HB-1

3 Deviations from Work Plan

The Work Plan included using a 2-dimensional version of the SEEP/w model. However, the 3-dimensional model provided more representative groundwater flow toward and under the HB under static and post-containment wall conditions. The 2-dimensional model is a cross-sectional flow model and does not take into consideration the natural gradient of the groundwater flow system. In contrast, the 3-dimensional model allowed for the groundwater flow toward the HB to be deflected by the containment wall being present within the flow path, which was more representative of the actual groundwater conditions. The simulated sections and wall embedment included only 1-scenario of wall embedment into the bedrock. This is due to the glacial till layer being thicker than anticipated and providing adequate cutoff without embedding the wall deeper into bedrock.

4 Results

4.1 SEEPAGE ANALYSIS

Once the model was developed, a series of iterations were run to simulate groundwater flow in cross sections of the site under different conditions, adjusted by inputting and changing the model parameters. A range of practical design parameters were parametrically adjusted to alternate containment wall designs. The results included herein provide a summary of various model runs completed as part of the PDI work. Additional model runs will be conducted as part of the 30% Remedial Design (RD). Figure 7 (included as an attachment to the *HB Summary Report*) shows the three (3) primary scenarios evaluated for the wall embedment depths.

Below is a summary of the expected ranges for the design parameters.

Wall Design Parameter	Expected Range
Hydraulic Conductivity	$1x10^{-8}$ to $1x10^{-6}$ cm/sec
Wall depth (Embedment into till or rock)	80 feet (5 to 10 ft into till) to 100 ft (5 ft into bedrock)
Thickness	2 to 4 ft

Note:
cm/sec - centimeter per second

The results of the seepage modelling are intended to be used to evaluate the design parameters of the HB containment wall.

4.2 SEEPAGE FLUX CALCULATIONS

The first step in the analysis was to develop a calibrated model using groundwater elevations measured in observation wells (OWs) and continuous multi-level tubes (CMTs) installed as part of the HB-1 PDI. Details of the model set up and calibration are included in Exhibit HB5-1. Model calibration consisted of matching simulated hydraulic head contours to groundwater elevations collected in CMT channels HA20-CMT-6 and HA20-CMT-3. Four model scenarios were evaluated in this analysis to simulate current site conditions and future embedment scenarios:

- **Current conditions**: Present day groundwater flow conditions without the containment wall or low permeability cap above the holding basin footprint.
- **Shallow wall embedment**: Containment wall embedment 5 ft into glacial till. A low permeability cap is present above the holding basin footprint and assigned 5% of the overall site recharge or 0.6 inches/year.
- **Intermediate wall embedment**: Containment wall embedment 10 ft into glacial till or to the top of bedrock. A low permeability cap is present above the holding basin footprint and assigned 5% of the overall site recharge or 0.6 inches/year.
- **Deep wall embedment**: Containment wall embedment 5 ft into bedrock. A low permeability cap is present above the holding basin footprint and assigned 5% of the overall site recharge or 0.6 inches/year.

The proposed containment wall footprint geometry was used to assign finite-element subdomain geometry that represents the portion of the ice contact deposit aquifer within the holding basin. This subdomain geometry was used for mass balance calculations of flow into and out of the ice-contact deposits. The steady-state seepage model simulation calculated the flux of water into the top domain of the holding basin footprint and flux out of the holding basin footprint horizontally through the ice-contact deposits under current conditions. The future condition model simulations included calculating the flux through the containment wall, and vertical flow out of the footprint through the underlying glacial till and bedrock. A simplified equation for this calculation is as follows:

$$\textbf{Flow into Holding Basin} - \textbf{Flow out of Holding Basin} = \sim\mathbf{0} \qquad \text{(Equation 1)}$$

Where:

Flow into Holding Basin: Charge into subdomain geometry vertically from ground surface and horizontal upgradient flow contributions through ice contact deposits and underlying glacial till and bedrock (current conditions) or containment wall (future condition).

Flow out of Holding Basin: Groundwater migration coming out of subdomain geometry horizontally through ice contact deposits (current conditions) or containment wall (future condition) or vertically through the underlying glacial till and bedrock (future condition).

For this analysis, the model calculation included the groundwater discharge rate in ft^3/day within the ice contact deposits with no wall present to represent existing conditions of groundwater migration from the HB. By increasing embedment depth of the simulated containment wall, the presence of the containment wall modified the hydraulic head contours to create a greater flow pathway out of the HB, influencing groundwater flow to migrate deeper beneath the toe of the wall, and decreasing the overall groundwater discharge rate.

The table below shows the various scenarios of the containment wall embedment depths modeled during this PDI, and the percent discharge reduction when compared to the current site conditions seepage flux from the ice contact deposit.

Embedment Scenario	Seepage Flux out of Holding Basin Domain	Percent Discharge Reduction from Current Conditions
Current conditions	6432 ft^3/day or 33.4 GPM	N/A
Shallow Wall (5 ft into Till)	2.60 ft^3/day or 0.0135 GPM	99.959%
Intermediate Wall (10 ft into Till)	2.47 ft^3/day or 0.0128 GPM	99.961%
Deep Wall (5 ft into rock)	2.42 ft^3/day or 0.0126 GPM	99.962%

Note:
GPM – gallons per minute

Seepage model results estimated that the reduction in flow out of the holding basin will decrease by greater than three orders of magnitude for all proposed containment wall embedment scenarios. Model results suggested a significant containment wall influence on the hydraulic head gradient when compared to current site conditions. As a result, the relative difference in flow rate between the three embedment scenarios is inconsequential.

4.3 MASS FLUX OF DEPLETED URANIUM FROM HOLDING BASIN

Per the ROD, the HB wall will need to be designed to mitigate the migration of groundwater containing depleted uranium (DU) flowing out of the basin for a minimum of 200 years and, to the extent reasonably achievable, for 1,000 years, which requires an analyses of mass flux as part of the design. To determine the flux of DU out of the HB under varying containment wall embedment depth scenarios, a mass flux calculation is included below using the seepage model flux and the existing DU concentration within the HB for the existing condition. The future flux includes the containment wall and a prediction of mass flux with no In-Situ Stabilization (ISS) and mass flux with ISS completed within the HB as outlined in the ROD. The proposed ISS will result in a reduction of DU available to be transported in groundwater. The following equation was used to determine the mass flux under the different modelled scenarios:

$$C^{*}S_x = C_x \qquad \text{(Equation 2)}$$

Where:
C_x = Aqueous concentration flux, gram/year
S_x = Seepage model flux, ft^3/year
C = Aqueous concentration, gram/ft^3

Note:

1. µg/L * 1.0E-09 = gram/cm^3
2. gram/cm^3 * 28,316.85 = gram/ft^3

Equation 2 above describes the mass balance relationship between groundwater discharge out of the holding basin footprint and aqueous concentration of DU. By assuming conservative transport of DU with groundwater flow, calculated seepage model flux out of the holding basin can be multiplied by the aqueous concentration of DU currently observed in holding basin observation wells, and future concentrations after proposed ISS reduction, to calculate percent aqueous mass reduction. The calculation detail is included in Exhibit HB5-1 and the results are summarized below.

Scenario	Aqueous Concentration Flux out of Holding Basin Domain (grams/year)	Percent Reduction from Current Conditions
Current conditions	205,000	N/A
Shallow Wall (5 ft into Till)	82.94	99.95958%
Intermediate Wall (10 ft into Till)	78.80	99.96160%
Deep Wall (5 ft into rock)	77.20	99.96238%
Shallow Wall Post ISS	1.66	99.99919%
Intermediate Wall Post ISS	1.58	99.99923%
Deep Wall Post ISS	1.54	99.99925%

Note:

1. Aqueous concentration of DU at location HB-13 (3,086.5 µg/L) used in analysis.
2. Post ISS condition assumes 98% reduction in DU within holding basin or to 61.73 µg/L.

Based on the mass flux calculation above, the containment wall embedment in glacial till or 5 ft into bedrock without any ISS completed provides a reduction of 99.96% mass flux of DU migration from the HB.

4.4 MODEL SENSITIVTY ANALYSES

A sensitivity evaluation was performed to assess the influence of four hydraulic parameters on the magnitude of seepage flux out of the holding basin. To determine if the evaluated hydraulic parameter results in observable model sensitivity, the seepage flux out of the holding basin domain is compared to the Base Case model for the current condition scenario before implementation of the containment wall, and all three embedment scenarios. For sensitivity adjustments that result in greater than 5% change from the Base Case Model runs, the parameter is considered sensitive. The following modeling parameters were adjusted as part of the sensitivity analysis:

Description	Base Case Model Value	Sensitivity Analysis Model Value
Ice Contact Deposit Hydraulic Conductivity	1.0E-02 cm/sec	5.0E-03 cm/sec 1.0E-03 cm/sec
Ice Contact Deposit Anistropy	0.1	1.0
Glacial Till Hydraulic Conductivity	1.0E-05 cm/sec	1.0E-04 cm/sec 1.0E-05 cm/sec
Slurry Wall Hydraulic Conductivity	1.0E-07 cm/sec	1.0E-06 cm/sec 1.0E-08 cm/sec

The first parameter evaluated is the hydraulic conductivity of the ice contact deposit. In-situ testing performed within overburden wells at the Site by Geosyntec Consultants, published in their Remedial Investigation report suggests the hydraulic conductivity of the ice contact deposit varies several orders of magnitude, with a geometric mean hydraulic conductivity of 3.98 ft/day or 1.4E-03 cm/sec. To determine model sensitivity to ice contact deposit hydraulic conductivity, we adjusted the hydraulic conductivity from the base model value of 1.0E-02 cm/sec to 5.0E-03 cm/sec and 1.0E-03 cm/sec. The analysis demonstrated that the seepage flux through the holding basin domain is sensitive to the ice contact deposit hydraulic conductivity during the current condition, or before the implementation of the containment wall. Decreasing the hydraulic conductivity by one order of magnitude results in an 89% decrease in seepage flux out of the holding basin, and a 49% decrease in seepage flux when reducing hydraulic conductivity by half an order of magnitude. For embedment scenarios the model was not sensitive to reducing the ice contact deposit hydraulic conductivity, with less than a 2% change in seepage flux across the three embedment scenarios and two hydraulic conductivity runs. The anisotropy, or vertical hydraulic conductivity to horizontal hydraulic conductivity ratio of the ice contact deposits was altered from the base case parameter value of 0.1 to 1.0 or setting the vertical and hydraulic conductivity values equal. The model results suggest there is slight sensitivity to this parameter in the current condition, increasing the seepage flux out of the holding basin domain by 5%, but is not sensitive during the containment wall embedment scenarios.

The analysis demonstrated that increasing the glacial till hydraulic conductivity by up to one order of magnitude results in no change to the seepage flux under the current condition, and approximately 1% change to the seepage flux under the three embedment scenarios. This scenario is representative of zones where the glacial till may be more granular or not as tightly bonded.

The final parameter for the model sensitivity evaluation is the simulated hydraulic conductivity of the containment wall. The expected design parameter range for the containment wall hydraulic conductivity is between 1.0E-06 to 1.0E-08 cm/sec. As part of the sensitivity evaluation, hydraulic conductivity of the containment wall was adjusted +/- one order of magnitude to determine if model results are sensitive to the design parameter range. Increasing the containment wall hydraulic conductivity one order of magnitude to 1.0E-06 cm/sec results in approximately a 37% increase in flux out of the holding basin domain for the shallow embedment scenario, a 12% increase in flux for the intermediate scenario, and less than 2% increase for the deep scenario. For the case in which the containment wall hydraulic conductivity is decreased an order of magnitude to 1.0E-08 cm/sec, the simulated seepage flux out of the holding basin domain will decrease 5% for the shallow embedment scenario, and 10% for the intermediate and deep embedment scenarios. Although the seepage model is sensitive to the containment wall hydraulic conductivity, it is worth noting that for the 1.0E-06 cm/sec wall simulations, the reduction in flow rate from current conditions is still three orders of magnitude for the shallow embedment scenario, or a decrease from approximately 6,432 ft^3/day to 3.58 ft^3/day.

The model sensitivity analysis results table is included in Exhibit HB5-1.

5 Summary of Future Design Considerations

As part of the 30% RD, additional geologic sections through the HB will be evaluated to consider the design of the containment wall to be toed into glacial till or bedrock. Under conditions where the till thickness is over 10 ft thick the wall will be evaluated to be 5 ft. and 10 ft. into glacial till. When the till thickness is less than 10 ft., the containment wall will extend 5 ft into bedrock. Various parameters to the model will be adjusted to evaluate the model sensitivity. As the design progresses, the following may be included with design refinements:

- Calculation of a relationship between K_h and K_v for the rock based on dip data. After calculating the corrected average dip, that value could be used to estimate the relationship between K_h and K_v.
- Adjustment of bedrock and glacial till anisotropy to refine the calibration of the model, and to see if the model is sensitive to these changes.
- Evaluation of vertical fractures in the bedrock as part of the bedrock hydraulic conductivity sensitivity analyses. The bedrock fracture dip angles will be tabulated for the borings completed along the wall alignment and site-wide data will be compiled for comparison. An average dip angle will be used for a near vertical fracture set through the rock within the footprint of the wall to evaluate the potential flux of DU through a set of vertical fractures below the wall.
- Simulation of additional holding basin cross sections to determine model sensitivity to stratigraphic unit geometry.
- Coordination with Geosyntec on the ISS attenuation of DU and adjustment of the % reduction in DU concentration within the HB. The current assumption is the ISS reduces the DU concentration by 98%. However, the net effect of the ISS is relatively minor as compared to the effect the containment wall has on the migration of DU from the HB.
- Development of a design-phase exploration program consisting of drilling test borings along the wall alignment to determine the toe embedment elevation of the containment wall around the entire HB. The toe of the containment wall may be mostly in glacial till other than areas where the till thickness is thinner. These portions of the wall will extend a minimum depth into bedrock to be determined by this drilling program.

PROBLEM STATEMENT & OBJECTIVE

1. Calculate total flow under and through the proposed Holding Basin containment wall at the Nuclear Metals, Inc. site using the seepage program SEEP/w 3D package.
2. Estimate groundwater seepage flux out of the Holding Basin for different wall embedment scenarios.

REFERENCES

7. Presentation titled "DRAFT Bedrock Groundwater Conceptual Model Update, Nuclear Metals Superfund Site" prepared by Geosyntec consultants dated October 2021.

ASSUMPTIONS

1. All scenarios assume steady state seepage analysis.
2. Groundwater elevation within the modeled cross section varies between El. 154 and El. 131.
3. Aquifer has infinite areal extent
4. Bedrock fracture dip angle assigned a value of 42.0 degrees based on Geosyntec's geometric mean value.
5. Overburden hydraulic gradient assumed to be 0.003 based on Geosyntec's value in "Attachment A Site Specific Uranium Transport Studies"
6. Vertical gradient from the bottom of the Ice Contact Deposit underneath the wall and back to the Ice Contact Deposit was calculated by dividing the change in head over the distance between each stratigraphic layer along the simulated flow pathline.

BOUNDARY CONDITIONS

1. A constant head boundary condition is set along the vertical edge of the eastern and western model domain, set to groundwater elevation 154 to 152 at the left domain and elevation 131 to the right domain. This value is based on approximate calibration to observed heads in CMT channels HA210-CMT-6 and HA20-CMT-3 collected in March 2021.
2. A recharge boundary condition is assigned to the top of the model domain representing 12 inches/year of groundwater recharge to the aquifer. For model runs simulating the holding basin, recharge above the holding basin is assigned 5% of the overal site recharge or 0.6 inches/year to represent the cap consisting of a low permeability liner.

MATERIAL PROPERTIES

Containment Wall Hydraulic Conducitivity	**1.0E-07 cm/sec**	**1.0E-06 cm/sec**	Shallow Wall	3.58	37.6%
			Intermediate Wall	2.77	12.1%
			Deep Wall	2.46	1.7%
		1.0E-08 cm/sec	Shallow Wall	2.46	-5.5%
			Intermediate Wall	2.22	-10.3%
			Deep Wall	2.17	-10.2%

Note:

1. Model simulation sensitivity analysis adjusts one parameter per model run.
2. Percent Change in Seepage Flux calculated by equation:

Percent Change in Seepage Flux = (Sensitivity Run Output Flux - Base Case Output Flux) / Base Case Output Flux

MADEP MCP Response Action Analytical Report Certification

This form provides certifications for all samples performed by MCP methods. Please refer to the Sample Results and Container Information sections of this report for specification of MCP methods used for each analysis. The following questions pertain only to MCP Analytical Methods.

An affirmative response to questions A through F is required for "Presumptive Certainty" status		
A	Were all samples received in a condition consistent with those described on the Chain-of-Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	YES
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	YES
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	YES
D	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data?"	YES
E a.	VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? (Refer to the individual method(s) for a list of significant modifications).	N/A
E b.	APH and TO-15 Methods only: Was the complete analyte list reported for each method?	N/A
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to Questions A through E)?	YES

A response to questions G, H and I is required for "Presumptive Certainty" status		
G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	YES
H	Were all QC performance standards specified in the CAM protocol(s) achieved?	NO
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	YES

For any questions answered "No", please refer to the case narrative section on the following page(s).

Please note that sample matrix information is located in the Sample Results section of this report.

Project Name:	NUCLEAR METALS	**Lab Number:**	L2116995
Project Number:	3252H	**Report Date:**	04/19/21

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L2116995-10: The analyses performed were specified by the client.

MCP Related Narratives

Volatile Organics

L2116995-01 through -09, and -11: Initial calibration utilized a quadratic fit for: n-butylbenzene, p-isopropyltoluene

L2116995-01 through -09, and -11: A copy of the continuing calibration standard is included as an addendum to this report.

In reference to question H:

L2116995-01 through -09, and -11: Initial Calibration did not meet:

Lowest Calibration Standard Minimum Response Factor: 1,4-dioxane (0.0025)

Average Response Factor: 1,4-dioxane

Semivolatile Organics

L2116995-01, -02, -03, -04, -05, -06, -07, -08, -09, WG1484239-1, WG1484239-2, and WG1484239-3: The initial calibration utilized a quadratic fit for Butyl benzyl phthalate, Bis(2-ethylhexyl)phthalate, Di-n-octylphthalate.

In reference to question H:

The WG1484239-1 Method Blank, associated with L2116995-01 through -09, has a concentration above the reporting limit for Bis(2-ethylhexyl)phthalate. Since the sample(s) were non-detect to the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.

The WG1484239-2/-3 LCS/LCSD recoveries, associated with L2116995-01 through -09, are below the

Project Name:	NUCLEAR METALS	**Lab Number:**	L2116995
Project Number:	3252H	**Report Date:**	04/19/21

Case Narrative (continued)

individual acceptance criteria for aniline (28%/32%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.
The WG1484239-2/-3 LCS/LCSD RPDs, associated with L2116995-01 through -09, are above the acceptance criteria for 1,3-dichlorobenzene (21%), hexachlorobutadiene (22%), hexachloroethane (21%), and naphthalene (21%).

Semivolatile Organics by SIM
WG1484244-2 and WG1484244-3: The initial calibration utilized a quadratic fit for Pentachlorophenol.

Non-MCP Related Narratives
Perfluorinated Alkyl Acids by Isotope Dilution
L2116995-08, -09, -10, -12, WG1484163-1, WG1484163-2, WG1484163-3, and WG1484163-4: Extracted Internal Standard recoveries were outside the acceptance criteria for individual analytes. Please refer to the surrogate section of the report for details.
L2116995-08, -09, -10, -12, WG1484163-3 and WG1484163-4: The MeOH fraction of the extraction is reported for the following compounds: Perfluorooctanesulfonamide (FOSA), N-Methyl Perfluorooctane Sulfonamide (NMeFOSA), N-Ethyl Perfluorooctane Sulfonamide (NEtFOSA), N-Methyl Perfluorooctanesulfonamido Ethanol (NMeFOSE), and N-Ethyl Perfluorooctanesulfonamido Ethanol (NEtFOSE) due to better extraction efficiency of the Surrogates (Extracted Internal Standards).
The WG1484163-1 Method Blank, associated with L2116995-08, -09, -10, and -12, has a concentration above the reporting limit for NEtFOSAA. Since the sample(s) were non-detect to the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.
The WG1484163-2 LCS recovery, associated with L2116995-08, -09, -10, and -12, is above the acceptance criteria for perfluorooctadecanoic acid (pfoda) (229%); however, the associated samples are non-detect to the RL for this target analyte. The results of the original analysis are reported.
The WG1484163-3 MS recovery, performed on L2116995-08, is outside the acceptance criteria for

Case Narrative (continued)

perfluorooctadecanoic acid (pfoda) (335%).

Nitrogen, Nitrate
The WG1483189-3 Laboratory Duplicate RPD for nitrogen, nitrate (10%), performed on L2116995-04, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

Dissolved Organic Carbon
The samples were field filtered; a filter blank was not received.

Anions by Ion Chromatography
The WG1485395-3 MS recovery, performed on L2116995-04, is outside the acceptance criteria for sulfate (68%) and chloride (31%); however, the associated LCS recovery is within criteria. No further action was taken.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

PFAS PARAMETER SUMMARY

Parameter	Acronym	CAS Number
PERFLUOROALKYL CARBOXYLIC ACIDS (PFCAs)		
Perfluorooctadecanoic Acid	PFODA	16517-11-6
Perfluorohexadecanoic Acid	PFHxDA	67905-19-5
Perfluorotetradecanoic Acid	PFTA	376-06-7
Perfluorotridecanoic Acid	PFTrDA	72629-94-8
Perfluorododecanoic Acid	PFDoA	307-55-1
Perfluoroundecanoic Acid	PFUnA	2058-94-8
Perfluorodecanoic Acid	PFDA	335-76-2
Perfluorononanoic Acid	PFNA	375-95-1
Perfluorooctanoic Acid	PFOA	335-67-1
Perfluoroheptanoic Acid	PFHpA	375-85-9
Perfluorohexanoic Acid	PFHxA	307-24-4
Perfluoropentanoic Acid	PFPeA	2706-90-3
Perfluorobutanoic Acid	PFBA	375-22-4
PERFLUOROALKYL SULFONIC ACIDS (PFSAs)		
Perfluorododecanesulfonic Acid	PFDoDS	79780-39-5
Perfluorodecanesulfonic Acid	PFDS	335-77-3
Perfluorononanesulfonic Acid	PFNS	68259-12-1
Perfluorooctanesulfonic Acid	PFOS	1763-23-1
Perfluoroheptanesulfonic Acid	PFHpS	375-92-8
Perfluorohexanesulfonic Acid	PFHxS	355-46-4
Perfluoropentanesulfonic Acid	PFPeS	2706-91-4
Perfluorobutanesulfonic Acid	PFBS	375-73-5
FLUOROTELOMERS		
1H,1H,2H,2H-Perfluorododecanesulfonic Acid	10:2FTS	120226-60-0
1H,1H,2H,2H-Perfluorodecanesulfonic Acid	8:2FTS	39108-34-4
1H,1H,2H,2H-Perfluorooctanesulfonic Acid	6:2FTS	27619-97-2
1H,1H,2H,2H-Perfluorohexanesulfonic Acid	4:2FTS	757124-72-4
PERFLUOROALKANE SULFONAMIDES (FASAs)		
Perfluorooctanesulfonamide	FOSA	754-91-6
N-Ethyl Perfluorooctane Sulfonamide	NEtFOSA	4151-50-2
N-Methyl Perfluorooctane Sulfonamide	NMeFOSA	31506-32-8
PERFLUOROALKANE SULFONYL SUBSTANCES		
N-Ethyl Perfluorooctanesulfonamido Ethanol	NEtFOSE	1691-99-2
N-Methyl Perfluorooctanesulfonamido Ethanol	NMeFOSE	24448-09-7
N-Ethyl Perfluorooctanesulfonamidoacetic Acid	NEtFOSAA	2991-50-6
N-Methyl Perfluorooctanesulfonamidoacetic Acid	NMeFOSAA	2355-31-9
PER- and POLYFLUOROALKYL ETHER CARBOXYLIC ACIDS		
2,3,3,3-Tetrafluoro-2-[1,1,2,2,3,3,3-Heptafluoropropoxy]-Propanoic Acid	HFPO-DA	13252-13-6
4,8-Dioxa-3h-Perfluorononanoic Acid	ADONA	919005-14-4
CHLORO-PERFLUOROALKYL SULFONIC ACIDS		
11-Chloroeicosafluoro-3-Oxaundecane-1-Sulfonic Acid	11Cl-PF3OUdS	763051-92-9
9-Chlorohexadecafluoro-3-Oxanone-1-Sulfonic Acid	9Cl-PF3ONS	756426-58-1
PERFLUOROETHER SULFONIC ACIDS (PFESAs)		
Perfluoro(2-Ethoxyethane)Sulfonic Acid	PFEESA	113507-82-7
PERFLUOROETHER/POLYETHER CARBOXYLIC ACIDS (PFPCAs)		
Perfluoro-3-Methoxypropanoic Acid	PFMPA	377-73-1
Perfluoro-4-Methoxybutanoic Acid	PFMBA	863090-89-5
Nonafluoro-3,6-Dioxaheptanoic Acid	NFDHA	151772-58-6

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
NR	- No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Project Name: NUCLEAR METALS **Lab Number:** L2116995
Project Number: 3252H **Report Date:** 04/19/21

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. (Note: 'PFAS, Total (6)' is applicable to MassDEP DW compliance analysis only.). If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Project Name:	NUCLEAR METALS	**Lab Number:**	L2116995
Project Number:	3252H	**Report Date:**	04/19/21

Data Qualifiers

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 625/625.1: alpha-Terpineol
EPA 8260C/8260D: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D/8270E: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine, alpha-Terpineol; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B, SM4500NO2-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

Non-Potable Water
SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1**: Ammonia-N, **LACHAT 10-107-06-1-B**: Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2**: Nitrate-N**, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300: Chloride, Sulfate, Nitrate.**

MADEP MCP Response Action Analytical Report Certification

This form provides certifications for all samples performed by MCP methods. Please refer to the Sample Results and Container Information sections of this report for specification of MCP methods used for each analysis. The following questions pertain only to MCP Analytical Methods.

An affirmative response to questions A through F is required for "Presumptive Certainty" status		
A	Were all samples received in a condition consistent with those described on the Chain-of-Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	YES
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	YES
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	YES
D	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data?"	YES
E a.	VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? (Refer to the individual method(s) for a list of significant modifications).	N/A
E b.	APH and TO-15 Methods only: Was the complete analyte list reported for each method?	N/A
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to Questions A through E)?	YES

A response to questions G, H and I is required for "Presumptive Certainty" status		
G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	YES
H	Were all QC performance standards specified in the CAM protocol(s) achieved?	NO
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	YES

For any questions answered "No", please refer to the case narrative section on the following page(s).

Please note that sample matrix information is located in the Sample Results section of this report.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission
All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

MCP Related Narratives
Volatile Organics
L2117259-01 through -14, -17, -25, -26, -29 and -30: Initial calibration utilized a quadratic fit for: n-butylbenzene, p-isopropyltoluene
L2117259-01, -02, -03, -04, -05, -07, -08, -09, -10, and -14: A copy of the continuing calibration standard is included as an addendum to this report.
In reference to question H:
L2117259-27: The surrogate recovery is above the acceptance criteria for 1,2-dichloroethane-d4 (139%) and dibromofluoromethane (141%). Since the sample was non-detect for all target analytes, re-analysis was not required.
The WG1487356-3/-4 LCS/LCSD recoveries, associated with L2117259-15, -16, -18, -19, -20, -22, -23, -24, and -27, are below the individual acceptance criteria for dichlorodifluoromethane (60%/64%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.
The WG1487616-3 LCS recovery, associated with L2117259-06, -11, -12, -13, -17, -29, and -30, is above the individual acceptance criteria for 1,2,3-trichloropropane (140%), but within the overall method allowances. The results of the associated samples are reported; however, all positive detects are considered to have a potentially high bias for this compound.
The WG1487775-3/-4 LCS/LCSD recoveries, associated with L2117259-25 and -26, are below the individual acceptance criteria for bromomethane (68%/69%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.
The WG1487616-6 MS recovery, performed on L2117259-17, is below the acceptance criteria for

Case Narrative (continued)

bromomethane (63%); however, the associated LCS/LCSD recoveries are within overall method allowances. No further action was required.

The WG1487616-7 MSD recovery, performed on L2117259-17, is outside the acceptance criteria for 1,2,3-trichloropropane (140%); however, the associated LCS/LCSD recoveries are within overall method allowances. No further action was required.

The WG1487616-6/-7 MS/MSD RPD, performed on L2117259-17, is outside the acceptance criteria for bromomethane (21%).

L2117259-01 through -14, -17, -25, -26, -29, and -30: Initial Calibration did not meet:

Lowest Calibration Standard Minimum Response Factor: 1,4-dioxane (0.0025)

Average Response Factor: 1,4-dioxane

L2117259-06, -11, -12, -13, -17, -29, and -30: Initial Calibration did not meet:

L2117259-15, -16, -18, -19, -20, -22, -23, -24, and -27: Initial Calibration did not meet:

Lowest Calibration Standard Minimum Response Factor: 1,4-dioxane (0.0095)

Average Response Factor: 1,4-dioxane

L2117259-06, -11, -12, -13, -15, -16, -17, -18, -19, -20, -22, -23, -24, -25, -26, -27, -29, and -30: The associated continuing calibration standard is outside the acceptance criteria for several compounds; however, it is within overall method allowances. A copy of the continuing calibration standard is included as an addendum to this report.

Semivolatile Organics

L2117259-01, -02, -03, -04, -05, -07, -08, -09, -11, -12, -13, -14, -15, -16, -17, -18, -23, -24, -25, -26, -27, -29, -30, WG1484239-1, WG1484239-2, WG1484239-3, WG1485004-1, WG1485004-2, WG1485004-3, WG1485004-4, WG1485004-5, WG1485004-6, WG1485004-7, WG1485277-3: The initial calibration utilized a quadratic fit for Butyl benzyl phthalate, Bis(2-ethylhexyl)phthalate, Di-n-octylphthalate.

In reference to question H:

The WG1484239-1 Method Blank, associated with L2117259-01, -02, -03, -04, -05, -07, and -15, has a concentration above the reporting limit for Bis(2-ethylhexyl)phthalate. Since the samples were non-detect to

Case Narrative (continued)

the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.
The WG1485277-1 Method Blank, associated with L2117259-10, has a concentration above the reporting limit for Naphthalene. Since the sample was non-detect to the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.
The WG1484239-2/-3 LCS/LCSD recoveries, associated with L2117259-01, -02, -03, -04, -05, -07, and -15, are below the individual acceptance criteria for aniline (28%/32%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.
The WG1484239-2/-3 LCS/LCSD RPDs, associated with L2117259-01, -02, -03, -04, -05, -07, and -15, are above the acceptance criteria for 1,3-dichlorobenzene (21%), hexachlorobutadiene (22%), hexachloroethane (21%) and naphthalene (21%).
The WG1485004-3 LCSD recovery, associated with L2117259-08, -09, -11, -12, -13, -14, -16, -17, -18, -19, -20, -22, -23, -24, -25, -26, -27, -29, and -30, is below the individual acceptance criteria for aniline (37%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.
The WG1485004-3 LCS/LCSD RPD(s), associated with L2117259-08, -09, -11, -12, -13, -14, -16, -17, -18, -19, -20, -22, -23, -24, -25, -26, -27, -29, and -30, are above the acceptance criteria for benzoic acid (23%) and pyridine (52%).
The WG1485277-2/-3 LCS/LCSD recoveries, associated with L2117259-10, are below the individual acceptance criteria for aniline (31%/25%) and 4-chloroaniline (LCS 34%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.
The WG1485277-2/-3 LCS/LCSD RPDs, associated with L2117259-10, are above the acceptance criteria for hexachlorobenzene (21%), 2,4-dinitrotoluene (22%), 2,6-dinitrotoluene (28%), azobenzene (21%), fluoranthene (25%), 4-bromophenyl phenyl ether (21%), naphthalene (23%), bis(2-ethylhexyl)phthalate (25%), butyl benzyl phthalate (27%), di-n-butylphthalate (27%), di-n-octylphthalate (27%), diethyl phthalate (26%), dimethyl phthalate (23%), benzo(a)pyrene (23%), benzo(b)fluoranthene (24%), benzo(k)fluoranthene (25%),

Case Narrative (continued)

acenaphthylene (23%), anthracene (22%), benzo(ghi)perylene (24%), phenanthrene (21%), dibenzo(a,h)anthracene (21%), indeno(1,2,3-cd)pyrene (22%), pyrene (25%), aniline (21%), 2,4,6-trichlorophenol (24%), 4-nitrophenol (32%), 2,4-dinitrophenol (30%), pentachlorophenol (30%) and 2,4,5-trichlorophenol (24%).

The WG1485004-4/-5 MS/MSD recoveries, performed on L2117259-14, are outside the acceptance criteria for aniline (14%/22%).

The WG1485004-4/-5 MS/MSD RPD, performed on L2117259-14, is outside the acceptance criteria for aniline (42%).

The WG1485004-6 MS recovery, performed on L2117259-17, is outside the acceptance criteria for aniline (26%).

The WG1485004-6/-7 MS/MSD RPDs, performed on L2117259-17, are outside the acceptance criteria for bis(2-chloroisopropyl)ether (24%), aniline (49%), and acetophenone (24%).

Semivolatile Organics by SIM

L2117259-01, -02, -04, -05, -07, -08, -09, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -20, -22, -23, -24, -25RE, -25, -26, -27, -29, -30, WG1484244-2, WG1485070-1,WG1485070-6, WG1484244-3, WG1485070-2, WG1485070-3, WG1485070-4, WG1485070-5, WG1485070-7, WG1485279-1, WG1485279-2, WG1485279-3, WG1488688-1, WG1488688-2, and WG1488688-3: The initial calibration utilized a quadratic fit for Pentachlorophenol.

In reference to question H:

L2117259-25: The internal standard (IS) response(s) for Chrysene-d12 (20%) and Perylene-d12 (0%) were below the acceptance criteria; however, the criteria were achieved upon re-analysis outside of holding time. The results of both analyses are reported; however, since the IS response was below method criteria, all associated compounds are considered to have a potentially high bias.

L2117259-25: The surrogate recovery is outside the individual acceptance criteria for 2,4,6-tribromophenol (187%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

Case Narrative (continued)

The WG1485279-1 Method Blank, associated with L2117259-10, has a concentration above the reporting limit for Acenaphthene, Naphthalene and 2-Methylnaphthalene. Since the sample was non-detect to the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.
The WG1485070-2/-3 LCS/LCSD RPD, associated with L2117259-08, -09, -11, -12, -13, -14, -16, -17, -18, -19, -20, -22, -23, -24, -26, -27, -29, and -30, are above the acceptance criteria for pentachlorophenol (21%).
The WG1485070-6/-7 MS/MSD RPD, performed on L2117259-17, is outside the acceptance criteria for pentachlorophenol (21%).
WG1485279-2: The surrogate recovery is outside the individual acceptance criteria for 2,4,6-tribromophenol (117%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.
WG1488688-1: The surrogate recovery is outside the individual acceptance criteria for 2,4,6-tribromophenol (113%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.
The WG1488688-2/-3 LCS/LCSD RPD, associated with L2117259-25RE, is above the acceptance criteria for naphthalene (21%).

Perfluorinated Alkyl Acids by Isotope Dilution
L2117259-03, -21, -27, -28, WG1484163-1, WG1484163-2: Extracted Internal Standard recoveries were outside the acceptance criteria for individual analytes. Please refer to the surrogate section of the report for details.
L2117259-03, -21, -27, and -28: The MeOH fraction of the extraction is reported for the following compounds: Perfluorooctanesulfonamide (FOSA), N-Methyl Perfluorooctane Sulfonamide (NMeFOSA), N-Ethyl Perfluorooctane Sulfonamide (NEtFOSA), N-Methyl Perfluorooctanesulfonamido Ethanol (NMeFOSE), and N-Ethyl Perfluorooctanesulfonamido Ethanol (NEtFOSE) due to better extraction efficiency of the Surrogates (Extracted Internal Standards).
The WG1484163-1 Method Blank, associated with L2117259-03, -21, -27, and -28, has a concentration

Case Narrative (continued)

above the reporting limit for NEtFOSAA. Since the sample(s) were non-detect to the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.
The WG1484163-2 LCS recovery, associated with L2117259-03, -21, -27, and -28, is above the acceptance criteria for perfluorooctadecanoic acid (pfoda) (229%); however, the associated samples are non-detect to the RL for this target analyte. The results of the original analysis are reported.

Non-MCP Related Narratives
Nitrogen, Nitrate
The WG1483191-4 MS recovery for nitrogen, nitrate (0%), performed on L2117259-01, does not apply because the sample concentration is greater than four times the spike amount added.

Dissolved Organic Carbon
The samples were field filtered; a filter blank was not received.
The WG1486448-4 MS recovery, performed on L2117259-04, is outside the acceptance criteria for dissolved organic carbon (132%); however, the associated LCS recovery is within criteria. No further action was taken.

Anions by Ion Chromatography
L2117259-13 was analyzed with the method required holding time exceeded.
The WG1485396-3 MS recoveries, performed on L2117259-20, are outside the acceptance criteria for sulfate (89%) and chloride (70%); however, the associated LCS recovery is within criteria. No further action was taken.
The WG1494273-4 MS recovery, performed on L2117259-18, is outside the acceptance criteria for fluoride (81%); however, the associated LCS recovery is within criteria. No further action was taken.

PFAS PARAMETER SUMMARY

Parameter	Acronym	CAS Number
PERFLUOROALKYL CARBOXYLIC ACIDS (PFCAs)		
Perfluorooctadecanoic Acid	PFODA	16517-11-6
Perfluorohexadecanoic Acid	PFHxDA	67905-19-5
Perfluorotetradecanoic Acid	PFTA	376-06-7
Perfluorotridecanoic Acid	PFTrDA	72629-94-8
Perfluorododecanoic Acid	PFDoA	307-55-1
Perfluoroundecanoic Acid	PFUnA	2058-94-8
Perfluorodecanoic Acid	PFDA	335-76-2
Perfluorononanoic Acid	PFNA	375-95-1
Perfluorooctanoic Acid	PFOA	335-67-1
Perfluoroheptanoic Acid	PFHpA	375-85-9
Perfluorohexanoic Acid	PFHxA	307-24-4
Perfluoropentanoic Acid	PFPeA	2706-90-3
Perfluorobutanoic Acid	PFBA	375-22-4
PERFLUOROALKYL SULFONIC ACIDS (PFSAs)		
Perfluorododecanesulfonic Acid	PFDoDS	79780-39-5
Perfluorodecanesulfonic Acid	PFDS	335-77-3
Perfluorononanesulfonic Acid	PFNS	68259-12-1
Perfluorooctanesulfonic Acid	PFOS	1763-23-1
Perfluoroheptanesulfonic Acid	PFHpS	375-92-8
Perfluorohexanesulfonic Acid	PFHxS	355-46-4
Perfluoropentanesulfonic Acid	PFPeS	2706-91-4
Perfluorobutanesulfonic Acid	PFBS	375-73-5
FLUOROTELOMERS		
1H,1H,2H,2H-Perfluorododecanesulfonic Acid	10:2FTS	120226-60-0
1H,1H,2H,2H-Perfluorodecanesulfonic Acid	8:2FTS	39108-34-4
1H,1H,2H,2H-Perfluorooctanesulfonic Acid	6:2FTS	27619-97-2
1H,1H,2H,2H-Perfluorohexanesulfonic Acid	4:2FTS	757124-72-4
PERFLUOROALKANE SULFONAMIDES (FASAs)		
Perfluorooctanesulfonamide	FOSA	754-91-6
N-Ethyl Perfluorooctane Sulfonamide	NEtFOSA	4151-50-2
N-Methyl Perfluorooctane Sulfonamide	NMeFOSA	31506-32-8
PERFLUOROALKANE SULFONYL SUBSTANCES		
N-Ethyl Perfluorooctanesulfonamido Ethanol	NEtFOSE	1691-99-2
N-Methyl Perfluorooctanesulfonamido Ethanol	NMeFOSE	24448-09-7
N-Ethyl Perfluorooctanesulfonamidoacetic Acid	NEtFOSAA	2991-50-6
N-Methyl Perfluorooctanesulfonamidoacetic Acid	NMeFOSAA	2355-31-9
PER- and POLYFLUOROALKYL ETHER CARBOXYLIC ACIDS		
2,3,3,3-Tetrafluoro-2-[1,1,2,2,3,3,3-Heptafluoropropoxy]-Propanoic Acid	HFPO-DA	13252-13-6
4,8-Dioxa-3h-Perfluorononanoic Acid	ADONA	919005-14-4
CHLORO-PERFLUOROALKYL SULFONIC ACIDS		
11-Chloroeicosafluoro-3-Oxaundecane-1-Sulfonic Acid	11Cl-PF3OUdS	763051-92-9
9-Chlorohexadecafluoro-3-Oxanone-1-Sulfonic Acid	9Cl-PF3ONS	756426-58-1
PERFLUOROETHER SULFONIC ACIDS (PFESAs)		
Perfluoro(2-Ethoxyethane)Sulfonic Acid	PFEESA	113507-82-7
PERFLUOROETHER/POLYETHER CARBOXYLIC ACIDS (PFPCAs)		
Perfluoro-3-Methoxypropanoic Acid	PFMPA	377-73-1
Perfluoro-4-Methoxybutanoic Acid	PFMBA	863090-89-5
Nonafluoro-3,6-Dioxaheptanoic Acid	NFDHA	151772-58-6

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
NR	- No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. (Note: 'PFAS, Total (6)' is applicable to MassDEP DW compliance analysis only.). If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Data Qualifiers

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 625/625.1: alpha-Terpineol
EPA 8260C/8260D: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D/8270E: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine, alpha-Terpineol; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B, SM4500NO2-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

Non-Potable Water
SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1**: Ammonia-N, **LACHAT 10-107-06-1-B**: Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2**: Nitrate-N**, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300: Chloride, Sulfate, Nitrate.**
EPA 624.1: Volatile Halocarbons & Aromatics,
EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs
EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045**: PCB-Oil.

MADEP MCP Response Action Analytical Report Certification

This form provides certifications for all samples performed by MCP methods. Please refer to the Sample Results and Container Information sections of this report for specification of MCP methods used for each analysis. The following questions pertain only to MCP Analytical Methods.

An affirmative response to questions A through F is required for "Presumptive Certainty" status		
A	Were all samples received in a condition consistent with those described on the Chain-of-Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	YES
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	YES
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	YES
D	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data?"	YES
E a.	VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? (Refer to the individual method(s) for a list of significant modifications).	N/A
E b.	APH and TO-15 Methods only: Was the complete analyte list reported for each method?	N/A
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to Questions A through E)?	YES

A response to questions G, H and I is required for "Presumptive Certainty" status		
G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	YES
H	Were all QC performance standards specified in the CAM protocol(s) achieved?	NO
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	YES

For any questions answered "No", please refer to the case narrative section on the following page(s).

Please note that sample matrix information is located in the Sample Results section of this report.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

MCP Related Narratives

Volatile Organics

L2117504-10, -12, -13, -14, -17, -19, -21, -22, -23, and -24: Initial calibration utilized a quadratic fit for: n-butylbenzene, p-isopropyltoluene

In reference to question H:

L2117504-07: The surrogate recoveries are above the acceptance criteria for 1,2-dichloroethane-d4 (137%) and dibromofluoromethane (134%). Since the sample was non-detect for all target analytes, re-analysis was not required.

L2117504-08: The surrogate recoveries are above the acceptance criteria for 1,2-dichloroethane-d4 (136%) and dibromofluoromethane (136%). Since the sample was non-detect for all target analytes, re-analysis was not required.

L2117504-09: The surrogate recoveries are above the acceptance criteria for 1,2-dichloroethane-d4 (133%) and dibromofluoromethane (131%). Since the sample was non-detect for all target analytes, re-analysis was not required.

L2117504-11: The surrogate recoveries are above the acceptance criteria for 1,2-dichloroethane-d4 (140%) and dibromofluoromethane (145%). Since the sample was non-detect for all target analytes, re-analysis was not required.

L2117504-15: The surrogate recoveries are above the acceptance criteria for 1,2-dichloroethane-d4 (142%) and dibromofluoromethane (138%). Since the sample was non-detect for all target analytes, re-analysis was not required.

L2117504-18: The surrogate recoveries are above the acceptance criteria for 1,2-dichloroethane-d4 (135%) and dibromofluoromethane (133%). Since the sample was non-detect for all target analytes, re-analysis was not required.

Case Narrative (continued)

The WG1487621-3/-4 LCS/LCSD recoveries, associated with L2117504-09, -11, -15, and -18, are below the individual acceptance criteria for dichlorodifluoromethane (60%/66%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for this compound.

The WG1487632-3/-4 LCS/LCSD recoveries, associated with L2117504-01 through -08, are outside the acceptance criteria for individual target compounds, but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially high bias for 1,4-dioxane (136%/134%) and a potentially low bias for dichlorodifluoromethane (62%/65%).

The WG1487906-3 LCS recoveries, associated with L2117504-10, -12, -13, -14, -17, -19, -21, -22, -23, and -24, are above the individual acceptance criteria for 1,1,2,2-tetrachloroethane (140%) and 1,2,3-trichloropropane (140%), but within the overall method allowances. The results of the associated samples are reported; however, all positive detects are considered to have a potentially high bias for these compounds.

The WG1487906-3/-4 LCS/LCSD RPD, associated with L2117504-10, -12, -13, -14, -17, -19, -21, -22, -23, and -24, is above the acceptance criteria for 1,4-dioxane (30%).

The WG1487906-6/-7 MS/MSD recoveries, performed on L2117504-23, are above the acceptance criteria for bromomethane (63%/69%); however, the associated LCS/LCSD recoveries are within overall method allowances. The results of the native sample are considered to have a potentially high bias for this compound.

The WG1487906-6/-7 MS/MSD RPD, performed on L2117504-23, is outside the acceptance criteria for 2-hexanone (26%).

L2117504-09, -11, -15, and -18: Initial Calibration did not meet:

Lowest Calibration Standard Minimum Response Factor: 1,4-dioxane (0.0095)

Average Response Factor: 1,4-dioxane

L2117504-01 through -08: Initial Calibration did not meet:

Lowest Calibration Standard Minimum Response Factor: 1,4-dioxane (0.0119)

Average Response Factor: 1,4-dioxane

L2117504-10, -12, -13, -14, -17, -19, -21, -22, -23, and -24: Initial Calibration did not meet:

Lowest Calibration Standard Minimum Response Factor: 1,4-dioxane (0.0025)

Project Name: NUCLEAR METALS **Lab Number:** L2117504
Project Number: 3252H **Report Date:** 04/22/21

Case Narrative (continued)

Average Response Factor: 1,4-dioxane

L2117504-20: Initial Calibration did not meet:

Lowest Calibration Standard Minimum Response Factor: 1,4-dioxane (0.0098)

Average Response Factor: 1,4-dioxane

L2117504-01 through -15 and -17 through -24: The associated continuing calibration standards are outside the acceptance criteria for several compounds; however, they are within overall method allowances. Copies of the continuing calibration standards are included as an addendum to this report.

Semivolatile Organics

L2117504-03, -04, -05, -06, -07, -08, -09, -10, -13, -14, -23, -24, WG1485004-1, WG1485277-3, WG1486007-1 and WG1485004-2/-3, WG1486007-2/-3 and WG1486007-4/-5: The initial calibration utilized a quadratic fit for Butyl benzyl phthalate, Bis(2-ethylhexyl)phthalate, Di-n-octylphthalate.

WG1486113-1/-2/-3: The initial calibration utilized a quadratic fit for Benzo(ghi)perylene.

In reference to question H:

L2117504-24: The surrogate recovery is outside the individual acceptance criteria for 2,4,6-tribromophenol (113%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

The WG1485277-1 Method Blank, associated with L2117504-03 through -10, has a concentration above the reporting limit for Naphthalene. Since the sample(s) were non-detect to the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.

The WG1485004-3 LCS/LCSD recoveries, associated with L2117504-01, are below the individual acceptance criteria for aniline (37%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.

The WG1485277-2 LCS recoveries, associated with L2117504-03 through -10, are below the individual acceptance criteria for aniline (31%) and 4-chloroaniline (34%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.

Case Narrative (continued)

The WG1485277-3 LCSD recovery, associated with L2117504-03 through -10, is below the individual acceptance criteria for aniline (25%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for this compound.

The WG1485277-2/-3 LCS/LCSD RPDs, associated with L2117504-03 through -10, are above the acceptance criteria for hexachlorobenzene (21%), 2,4-dinitrotoluene (22%), 2,6-dinitrotoluene (28%), azobenzene (21%), fluoranthene (25%), 4-bromophenyl phenyl ether (21%), naphthalene (23%), bis(2-ethylhexyl)phthalate (25%), butyl benzyl phthalate (27%), di-n-butylphthalate (27%), di-n-octylphthalate (27%), diethyl phthalate (26%), dimethyl phthalate (23%), benzo(a)pyrene (23%), benzo(b)fluoranthene (24%), benzo(k)fluoranthene (25%), acenaphthylene (23%), anthracene (22%), benzo(ghi)perylene (24%), phenanthrene (21%), dibenzo(a,h)anthracene (21%), indeno(1,2,3-cd)pyrene (22%), pyrene (25%), aniline (21%), 2,4,6-trichlorophenol (24%), 4-nitrophenol (32%), 2,4-dinitrophenol (30%), pentachlorophenol (30%) and 2,4,5-trichlorophenol (24%).

The WG1486007-2 LCS recoveries, associated with L2117504-01, -03, -04, -05, -06, -07, -08, -09, -10, -11, -12, -14, -15, -18, -19, -20, -21, -22, -23, and -24, are below the individual acceptance criteria for 3,3'-dichlorobenzidine (27%), aniline (16%) and 4-chloroaniline (30%) but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.

The WG1486007-3 LCSD recovery, associated with L2117504-01, -03, -04, -05, -06, -07, -08, -09, -10, -11, -12, -14, -15, -18, -19, -20, -21, -22, -23, and -24, is below the individual acceptance criteria for aniline (39%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for this compound.

The WG1486007-2/-3 LCS/LCSD RPDs, associated with L2117504-01, -03, -04, -05, -06, -07, -08, -09, -10, -11, -12, -14, -15, -18, -19, -20, -21, -22, -23, and -24, are above the acceptance criteria for 1,4-dichlorobenzene (22%), 3,3'-dichlorobenzidine (74%), bis(2-chloroisopropyl)ether (21%), hexachlorobutadiene (22%), hexachloroethane (23%), naphthalene (24%), nitrobenzene (25%), aniline (84%), 4-chloroaniline (31%), acetophenone (22%), 2-chlorophenol (26%), 2,4-dimethylphenol (34%), 2-nitrophenol (24%), phenol (30%), 2-methylphenol (24%) and 3-methylphenol/4-methylphenol (21%).

Case Narrative (continued)

The WG1486007-4/-5 MS/MSD recoveries, performed on L2117504-23, are outside the acceptance criteria for 3,3'-dichlorobenzidine (26%/36%), aniline (30%/30%) and 4-chloroaniline (33%/36%).
The WG1486007-4/-5 MS/MSD RPD, performed on L2117504-23, is outside the acceptance criteria for 3,3'-dichlorobenzidine (32%).
The WG1486113-2/-3 LCS/LCSD recoveries, associated with L2117504-12, -13, -15, -18, -19, -20, -21, and -22, are below the individual acceptance criteria for aniline (32%/35%), but within the overall method allowances. The results of the associated samples are reported; however, all results are considered to have a potentially low bias for these compounds.
The WG1486113-2/-3 LCS/LCSD RPDs, associated with L2117504-12, -13, -15, -18, -19, -20, -21, and -22, are above the acceptance criteria for 1,2,4-trichlorobenzene (21%), bis(2-chloroethyl)ether (23%), 2-chloronaphthalene (29%), 1,2-dichlorobenzene (31%), 1,3-dichlorobenzene (21%), 3,3'-dichlorobenzidine (24%), 2,6-dinitrotoluene (24%), bis(2-chloroisopropyl)ether (30%), hexachlorobutadiene (24%), hexachloroethane (28%), isophorone (28%), nitrobenzene (41%), dimethyl phthalate (22%), acenaphthylene (27%), dibenzofuran (21%), 2-methylnaphthalene (32%), acetophenone (26%), 2,4,6-trichlorophenol (24%), 2-chlorophenol (29%), 2,4-dichlorophenol (29%), 2-nitrophenol (29%), 2-methylphenol (24%), 3-methylphenol/4-methylphenol (24%) and 2,4,5-trichlorophenol (30%).
The surrogate recoveries for the WG1486113-3 LCSD, associated with L2117504-12, -13, -15, -18, -19, -20, -21, and -22, are outside the acceptance criteria for 2-fluorophenol (111%) and 2,4,6-tribromophenol (129%).

Semivolatile Organics by SIM
L2117504-01, -03, -04RE, -07, -08RE, -11, -12, -17, -18, and -23: The initial calibration utilized a quadratic fit for Pentachlorophenol.
L2117504-03RE, -05, -06, -09, -10, -14, -15, -19, -20, -21, -22, and -24: The initial calibration utilized a quadratic fit for Pentachlorophenol.
WG1485070-1, WG1486021-1/-3, WG1486021-4/-5 and WG1486116-1/-2: The initial calibration utilized a quadratic fit for Pentachlorophenol.

Case Narrative (continued)

WG1485070-2/-3, WG1485279-1, WG1485279-2/-3, WG1486021-2, and WG1486116-3: The initial calibration utilized a quadratic fit for Pentachlorophenol.

In reference to question H:

L2117504-19: The surrogate recovery is outside the individual acceptance criteria for 4-terphenyl-d14 (137%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

L2117504-20: The surrogate recovery is outside the individual acceptance criteria for 2,4,6-tribromophenol (122%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

L2117504-24: The surrogate recovery is outside the individual acceptance criteria for 2,4,6-tribromophenol (151%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

The WG1485070-2/-3 LCS/LCSD RPD, associated with L2117504-01, is above the acceptance criteria for pentachlorophenol (21%).

The WG1485279-1 Method Blank, associated with L2117504-05, -06, -07, -09, -10, and -17, has a concentration above the reporting limit for Acenaphthene, Naphthalene and 2-Methylnaphthalene. The results of the original analysis are reported and are qualified with a "B" for any associated sample concentrations that are less than 10x the blank concentration for this analyte.

WG1485279-2: The surrogate recovery is outside the individual acceptance criteria for 2,4,6-tribromophenol (117%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

WG1486021-2/-3: The surrogate recoveries are outside the individual acceptance criteria for 2,4,6-tribromophenol (127%/121%) and 4-terphenyl-d14 (137%/134%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

The WG1486021-2 LCS recovery, associated with L2117504-11, -12, -14, -15, -18, -19, -20, -21, -22, -23, and -24, is above the individual acceptance criteria for benzo(k)fluoranthene (141%), but within the overall

Case Narrative (continued)

method allowances. The results of the associated samples are reported; however, all positive detects are considered to have a potentially high bias for these compounds.
WG1488688-1: The surrogate recovery is outside the individual acceptance criteria for 2,4,6-tribromophenol (113%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.
The WG1486116-2/-3 LCS/LCSD RPD, associated with L2117504-13, is above the acceptance criteria for pentachlorophenol (24%).

Non-MCP Related Narratives
Perfluorinated Alkyl Acids by Isotope Dilution
L2117504-11, -12, -16 and WG1484163-1/-2: Extracted Internal Standard recoveries were outside the acceptance criteria for individual analytes. Please refer to the surrogate section of the report for details.
L2117504-11, -12, and -16: The MeOH fraction of the extraction is reported for the following compounds: Perfluorooctanesulfonamide (FOSA), N-Methyl Perfluorooctane Sulfonamide (NMeFOSA), N-Ethyl Perfluorooctane Sulfonamide (NEtFOSA), N-Methyl Perfluorooctanesulfonamido Ethanol (NMeFOSE), and N-Ethyl Perfluorooctanesulfonamido Ethanol (NEtFOSE) due to better extraction efficiency of the Surrogates (Extracted Internal Standards).
The WG1484163-1 Method Blank, associated with L2117504-11, -12, and -16, has a concentration above the reporting limit for NEtFOSAA. Since the sample(s) were non-detect to the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.
The WG1484163-2 LCS recovery, associated with L2117504-11, -12, and -16, is above the acceptance criteria for perfluorooctadecanoic acid (pfoda) (229%); however, the associated samples are non-detect to the RL for this target analyte. The results of the original analysis are reported.

Alkalinity, Bicarbonate
L2117504-12: The Equipment Blank has a concentration above the reporting limit for Alkalinity, Bicarbonate.

Project Name: NUCLEAR METALS **Lab Number:** L2117504
Project Number: 3252H **Report Date:** 04/22/21

Case Narrative (continued)

Nitrogen, Nitrate

The WG1484145-4 MS recovery, performed on L2117504-19, is outside the acceptance criteria for nitrogen, nitrate (162%); however, the associated LCS recovery is within criteria. No further action was taken.

The WG1484147-4 MS recovery, performed on L2117504-23, is outside the acceptance criteria for nitrogen, nitrate (142%); however, the associated LCS recovery is within criteria. No further action was taken.

Nitrogen, Nitrite

The WG1484146-4 MS recovery, performed on L2117504-23, is outside the acceptance criteria for nitrogen, nitrite (125%); however, the associated LCS recovery is within criteria. No further action was taken.

Dissolved Organic Carbon

The samples were field filtered; a filter blank was not received.

Anions by Ion Chromatography

The WG1485869-3 MS recovery, performed on L2117504-11, is outside the acceptance criteria for sulfate (86%); however, the associated LCS recovery is within criteria. No further action was taken.

The WG1485870-3 MS recovery, performed on L2117504-18, is outside the acceptance criteria for chloride (69%); however, the associated LCS recovery is within criteria. No further action was taken.
